

Package ‘edm1’

September 9, 2024

Title Simplify Complex Data Manipulation

Version 2.0.0.0

Description Provides complex sorting algorithms. Provides date manipulation algorithms. In addition to providing handy functions to discretize variables, an SQL joins alternatives, a set of function to work with geographical coordinates, and other functions to work with text mining.

License GPL (==3)

all_concat	<i>all_concat</i>
------------	-------------------

Description

Output all the possible concatenations of elements in different vectors, see examples

Usage

```
all_concat(..., sep = "_")
```

Arguments

...	is all the vectors of the elements that will be concatenated, see examples
sep	is the separator to use between concatenated elements

Examples

```
print(all_concat(c("France", "Germany"), c("2012", "2013"), c(1:2), sep = "_"))

[1] "France_2012_1" "Germany_2012_1" "France_2013_1" "Germany_2013_1"
[5] "France_2012_2" "Germany_2012_2" "France_2013_2" "Germany_2013_2"
```

all_stat

*all_stat***Description**

Allow to see all the main statistics indicators (mean, median, variance, standard deviation, sum, max, min, quantile) of variables in a dataframe by the modality of a variable in a column of the input datarame. In addition to that, you can get the occurrence of other qualitative variables by your chosen qualitative variable, you have just to precise it in the vector "stat_var" where all the statistics indicators are given with "occu-var_you_want/".

Usage

```
all_stat(inpt_v, var_add = c(), stat_var = c(), inpt_datf)
```

Arguments

inpt_v is the modalities of the variables
var_add is the variables you want to get the stats from
stat_var is the stats indicators you want
inpt_datf is the input dataframe

Examples

```
datf <- data.frame("mod"=c("first", "seco", "seco", "first", "first", "third", "first"),
  "var1"=c(11, 22, 21, 22, 22, 11, 9),
  "var2"=c("d", "d", "z", "z", "z", "d", "z"),
  "var3"=c(45, 44, 43, 46, 45, 45, 42),
  "var4"=c("A", "A", "A", "A", "B", "C", "C"))

print(all_stat(inpt_v=c("first", "seco"), var_add = c("var1", "var2", "var3", "var4"),
  stat_var=c("sum", "mean", "median", "sd", "occu-var2/", "occu-var4/", "variance",
"quantile-0.75/"),
  inpt_datf=datf))

#   modal_v var_vector occu sum mean  med standard_devaition      variance

`and_bool1`*and_bool1*

Description

Returns a boolean vector according to 'and' condition on boolean vector in a dataframe, each column represents a boolean vector, see examples

Usage

```
and_bool1(inpt_datf)
```

Examples

```
print(and_bool1(inpt_datf = data.frame("bool1" = c(TRUE, FALSE, FALSE, TRUE),
                                         "bool2" = c(TRUE, TRUE, FALSE, TRUE))))

[1]  TRUE FALSE FALSE  TRUE
```

`and_bool2`*and_bool2*

Description

Returns a boolean vector according to 'and' condition on boolean vector in a dataframe, each column represents a boolean vector, see examples, uses a different algorithm than and_bool1

Usage

```
and_bool2(inpt_datf)
```

Examples

```
print(and_bool2(inpt_datf = data.frame("bool1" = c(TRUE, FALSE, FALSE, TRUE),
                                         "bool2" = c(TRUE, TRUE, FALSE, TRUE))))

[1] TRUE FALSE FALSE TRUE
```

any_join_datf	<i>any_join_datf</i>
---------------	----------------------

Description

Allow to perform SQL joints with more features

Usage

```
any_join_datf(
  inpt_datf_l,
  join_type = "inner",
  join_spe = NA,
  id_v = c(),
  excl_col = c(),
  rtn_col = c(),
  d_val = NA
)
```

Arguments

<code>inpt_datf_l</code>	is a list containing all the dataframe
<code>join_type</code>	is the joint type. Defaults to inner but can be changed to a vector containing all the dataframes you want to take their ids to don external joints.
<code>join_spe</code>	can be equal to a vector to do an external joints on all the dataframes. In this case, <code>join_type</code> should not be equal to "inner"
<code>id_v</code>	is a vector containing all the ids name of the dataframes. The ids names can be changed to number of their columns taking in count their position in <code>inpt_datf_l</code> . It means that if my id is in the third column of the second dataframe and the first dataframe have 5 columns, the column number of the ids is $5 + 3 = 8$
<code>excl_col</code>	is a vector containing the column names to exclude, if this vector is filled so "rtn_col" should not be filled. You can also put the column number in the manner indicated for "id_v". Defaults to <code>c()</code>
<code>rtn_col</code>	is a vector containing the column names to retain, if this vector is filled so "excl_col" should not be filled. You can also put the column number in the manner indicated for "id_v". Defaults to <code>c()</code>
<code>d_val</code>	is the default val when here is no match

Examples

```
datf1 <- data.frame("val"=c(1, 1, 2, 4), "ids"=c("e", "a", "z", "a"),  
"last"=c("oui", "oui", "non", "oui"),  
"second_ids"=c(13, 11, 12, 8), "third_col"=c(4:1))  
  
datf2 <- data.frame("val"=c(3, 7, 2, 4, 1, 2), "ids"=c("a", "z", "z", "a", "a", "a"),  
"bool"=c(TRUE, FALSE, FALSE, FALSE, TRUE, TRUE),  
"second_ids"=c(13, 12, 8, 34, 22, 12))  
  
datf3 <- data.frame("val"=c(1, 9, 2, 4), "ids"=c("a", "a", "z", "a"),  
"last"=c("oui", "oui", "non", "oui"),  
"second_ids"=c(13, 11, 12, 8))  
  
print(any_join_datf(inpt_datf_l=list(datf1, datf2, datf3), join_type="inner",

#3      12
#4      11
```

appndr	<i>appndr</i>
--------	---------------

Description

Append to a vector "inpt_v" a special value "val" n times "mmn". The appending begins at "strt" index.

Usage

```
appndr(inpt_v, val = NA, hmn, strt = "max")
```

Arguments

- inpt_v is the input vector
- val is the special value
- hmn is the number of special value element added
- strt is the index from which appending begins, defaults to max which means the end of "inpt_v"

Examples

```
print(appndr(inpt_v=c(1:3), val="oui", hmn=5))

#[1] "1"    "2"    "3"    "oui" "oui" "oui" "oui" "oui"

print(appndr(inpt_v=c(1:3), val="oui", hmn=5, strt=1))

#[1] "1"    "oui" "oui" "oui" "oui" "oui" "2"    "3"
```

arroundr_mean	<i>arroundr_mean</i>
---------------	----------------------

Description

Takes an ascendly int ordered vector as input and assigns each elements that are close enough to the same value accrdng to a step value (step_value), see examples.

Usage

```
arroundr_mean(inpt_v = c(), step_val)
```

Arguments

inpt_v	is the input vector
step_val	is the step_value

Examples

```
x <- arroundr_mean(inpt_v = c(-11:25), step_val = 5)
print(x)
print(length(x))

[1] -9.0 -9.0 -9.0 -9.0 -9.0 -4.0 -4.0 -4.0 -4.0 -4.0  1.0  1.0  1.0  1.0  1.0
[16]  6.0  6.0  6.0  6.0  6.0 11.0 11.0 11.0 11.0 11.0 16.0 16.0 16.0 16.0 16.0
[31] 21.0 21.0 21.0 21.0 21.0 23.8 23.8
[1] 37
```

arroundr_min	<i>arroundr_min</i>
--------------	---------------------

Description

Takes an ascendly int ordered vector as input and assigns each elements that are close enough to the same value accrdng to a step value (step_value), see examples.

Usage

```
arroundr_min(inpt_v = c(), step_val)
```

Arguments

inpt_v is the input vector
step_val is the step value

Examples

```
print(arroundr_min(inpt_v = c(-11:25), step_val = 5))  
  
[1] -11 -11 -11 -11 -11 -11 -11 -6 -6 -6 -6 -6 -1 -1 -1 -1 -1 4 4 4  
[20] 4 4 9 9 9 9 9 9 14 14 14 14 14 19 19 19 19 19 24
```

better_match	<i>better_match</i>
--------------	---------------------

Description

Allow to get the nth element matched in a vector

Usage

```
better_match(inpt_v = c(), ptrn, until = 1, nvr_here = NA)
```

Arguments

inpt_v is the input vector
ptrn is the pattern to be matched
until is the maximum number of matched pattern outputed
nvr_here is a value you are sure is not present in inpt_v

Examples

```
print(better_match(inpt_v=c(1:12, 3, 4, 33, 3), ptrn=3, until=1))  
  
#[1] 3  
  
print(better_match(inpt_v=c(1:12, 3, 4, 33, 3), ptrn=3, until=5))  
  
#[1] 3 13 16  
  
print(better_match(inpt_v=c(1:12, 3, 4, 33, 3), ptrn=c(3, 4), until=5))  
  
[1] 3 13 16 4 14  
  
print(better_match(inpt_v=c(1:12, 3, 4, 33, 3), ptrn=c(3, 4), until=c(1, 5)))  
  
[1] 3 4 14
```

better_split	<i>better_split</i>
--------------	---------------------

Description

Allows to split a string by multiple split, returns a vector and not a list.

Usage

```
better_split(inpt, split_v = c())
```

Arguments

inpt	is the input character
split_v	is the vector containing the splits

Examples

```
print(better_split(inpt = "o-u_i", split_v = c("-")))  
[1] "o"    "u_i"  
  
print(better_split(inpt = "o-u_i", split_v = c("-", "_")))  
[1] "o" "u" "i"
```

better_split_any	<i>better_split_any</i>
------------------	-------------------------

Description

Allows to split a string by multiple split regardless of their length, returns a vector and not a list.
Contrary to better_split, this functions keep the delimiters in the output.

Usage

```
better_split_any(inpt, split_v = c())
```

Arguments

inpt	is the input character
split_v	is the vector containing the splits

Examples

```

print(better_split_any(inpt = "o-u_i", split_v = c("-")))

[1] "o"  "-" "u_i"

print(better_split_any(inpt = "o-u_i", split_v = c("-", "_")))

[1] "o"  "-" "u"  "_" "i"

print(better_split_any(inpt = "--o--_/m/m/___opo-/m/-u_i_--", split_v = c("--", "_", "/"

[1] "--"      "o"      "--"      "_"      "/"      "m"      "/"      "m"      "/"
[10] "_"      "_"      "-opo-"   "/"      "m"      "/"      "-u"      "_"      "i-"
[19] "_"      "--"

print(better_split_any(inpt = "(ok(ee:56))(ok2(oui)(ee:4))", split_v = c("(", ")", ":")))

[1] "("      "ok"      "("      "ee"      ":"      "56"      ")"      ")"      "("      "ok2"      "("      "oui"
[13] ")"      "("      "ee"      ":"      "4"      ")"      ")"

```

better_sub

*better_sub***Description**

Allow to perform a sub operation to a given number of matched patterns, see examples

Usage

```
better_sub(inpt_v = c(), pattern, replacement, until_v = c())
```

Arguments

inpt_v	is a vector containing all the elements that contains expressions to be substituted
pattern	is the expression that will be substituted
replacement	is the expression that will substitute pattern
until_v	is a vector containing, for each element of inpt_v, the number of pattern that will be substituted

Examples

```

print(better_sub(inpt_v = c("yes NAME, i will call NAME and NAME",
                             "yes NAME, i will call NAME and NAME"),
               pattern = "NAME",
               replacement = "Kevin",
               until = c(2)))

[1] "yes Kevin, i will call Kevin and NAME"
[2] "yes Kevin, i will call Kevin and NAME"

```

```

print(better_sub(inpt_v = c("yes NAME, i will call NAME and NAME",
                           "yes NAME, i will call NAME and NAME"),
      pattern = "NAME",
      replacement = "Kevin",
      until = c(2, 3)))

[1] "yes Kevin, i will call Kevin and NAME"
[2] "yes Kevin, i will call Kevin and Kevin"

print(better_sub(inpt_v = c("yes NAME, i will call NAME and NAME",
                           "yes NAME, i will call NAME and NAME"),
      pattern = "NAME",
      replacement = "Kevin",
      until = c("max", 3)))

[1] "yes Kevin, i will call Kevin and Kevin"
[2] "yes Kevin, i will call Kevin and Kevin"

```

better_sub_mult	<i>better_sub_mult</i>
-----------------	------------------------

Description

Allow to perform a sub_mult operation to a given number of matched patterns, see examples

Usage

```

better_sub_mult(
  inpt_v = c(),
  pattern_v = c(),
  replacement_v = c(),
  until_v = c()
)

```

Arguments

<code>inpt_v</code>	is a vector containing all the elements that contains expressions to be substituted
<code>pattern_v</code>	is a vector containing all the patterns to be substituted in any elements of <code>inpt_v</code>
<code>replacement_v</code>	is a vector containing the expression that are going to substitute those provided by <code>pattern_v</code>
<code>until_v</code>	is a vector containing, for each element of <code>inpt_v</code> , the number of pattern that will be substituted

Examples

```

print(better_sub_mult(inpt_v = c("yes NAME, i will call NAME and NAME2",
                                "yes NAME, i will call NAME and NAME2, especially NAME2"),
  pattern_v = c("NAME", "NAME2"),
  replacement_v = c("Kevin", "Paul"),
  until = c(1, 3)))

```

```
[1] "yes Kevin, i will call NAME and Paul"
[2] "yes Kevin, i will call NAME and Paul, especially Paul"

print(better_sub_mult(inpt_v = c("yes NAME, i will call NAME and NAME2",
                                "yes NAME, i will call NAME and NAME2, especially NAME2"),
                    pattern_v = c("NAME", "NAME2"),
                    replacement_v = c("Kevin", "Paul"),
                    until = c("max", 3)))

[1] "yes Kevin, i will call Kevin and Kevin2"
[2] "yes Kevin, i will call Kevin and Kevin2, especially Kevin2"
```

better_unique	<i>better_unique</i>
---------------	----------------------

Description

Returns the element that are not unique from the input vector

Usage

```
better_unique(inpt_v, occu = ">-1-")
```

Arguments

<code>inpt_v</code>	is the input vector containing the elements
<code>occu</code>	is a parameter that specifies the occurrence of the elements that must be returned, defaults to ">-1-" it means that the function will return all the elements that are present more than one time in <code>inpt_v</code> . The syntax is the following "comparaison_type-actual_value-". The comparaison type may be "==" or ">" or "<". Occu can also be a vector containing all the occurrence that must have the elements to be returned.

Examples

```
print(better_unique(inpt_v=c("oui", "oui", "non", "non", "peut", "peut1", "non")))
#[1] "oui" "non"

print(better_unique(inpt_v=c("oui", "oui", "non", "non", "peut", "peut1", "non"), occu="=")
#[1] "oui"

print(better_unique(inpt_v=c("oui", "oui", "non", "non", "peut", "peut1", "non"), occu=">")
#[1] "non"

print(better_unique(inpt_v=c("oui", "oui", "non", "non", "peut", "peut1", "non"), occu=c("=", ">"))
#[1] "non" "peut" "peut1"
```

```
print(better_unique(inpt_v = c("a", "b", "c", "c"), occu = "=="-1-"))
[1] "a" "b"

print(better_unique(inpt_v = c("a", "b", "c", "c"), occu = "<-2-"))
[1] "a" "b"
```

bind_cols

bind_cols

Description

Allow to find the cols of a dataframe in an other dataframe, see examples

Usage

```
bind_cols(from_datf, in_datf)
```

Arguments

`from_datf` is the dataframe that contains the cols to find among other cols
`in_datf` is the dataframe that only contains the cols to find in `from_datf`

Examples

```
iris[, 5] <- as.character(iris[, 5])
iris <- cbind(iris, iris[, 4])
from_datf <- iris
in_datf <- iris[, c(1, 2, 2, 2, 4)]
bind_cols(from_datf = from_datf,
          in_datf = in_datf)

[[1]]
[1] 1

[[2]]
[1] 2

[[3]]
[1] 2

[[4]]
[1] 2

[[5]]
[1] 4 6
```

bind_rows	<i>bind_rows</i>
-----------	------------------

Description

Allow to find the rows of a dataframe in an other dataframe, see examples

Usage

```
bind_rows(from_datf, in_datf)
```

Arguments

from_datf is the dataframe that contains the rows to find among other rows
in_datf is the dataframe that only contains the rows to find in from_datf

Examples

```
iris[, 5] <- as.character(iris[, 5])
from_datf <- iris
in_datf <- iris[c(4, 2, 23, 21, 11), ]

bind_rows(from_datf = from_datf,
          in_datf = in_datf)

[[1]]
[1] 4

[[2]]
[1] 2

[[3]]
[1] 23

[[4]]
[1] 21

[[5]]
[1] 11
```

can_be_num	<i>can_be_num</i>
------------	-------------------

Description

Return TRUE if a variable can be converted to a number and FALSE if not (supports float)

Usage

```
can_be_num(x)
```

Arguments

`x` is the input value

Examples

```
print(can_be_num("34.677"))
#[1] TRUE

print(can_be_num("34"))
#[1] TRUE

print(can_be_num("3rt4"))
#[1] FALSE

print(can_be_num(34))
#[1] TRUE
```

closer_ptrn

closer_ptrn

Description

Take a vector of patterns as input and output each chosen word with their closest patterns from chosen patterns.

Usage

```
closer_ptrn(
  inpt_v,
  base_v = c("?", letters),
  excl_v = c(),
  rtn_v = c(),
  sub_excl_v = c(),
  sub_rtn_v = c()
)
```

Arguments

<code>inpt_v</code>	is the input vector containing all the patterns
<code>base_v</code>	must contain all the characters that the patterns are susceptible to contain, defaults to <code>c("?", letters)</code> . "?" is necessary because it is internally the default value added to each element that does not have a sufficient length compared to the longest pattern in <code>inpt_v</code> . If set to NA, the function will find by itself the elements to be filled with but it may take an extra time
<code>excl_v</code>	is the vector containing all the patterns from <code>inpt_v</code> to exclude for comparing them to others patterns. If this parameter is filled, so <code>"rtn_v"</code> must be empty.

`rtn_v` is the vector containing all the patterns from `inpt_v` to keep for comparing them to others patterns. If this parameter is filled, so `"rtn_v"` must be empty.

`sub_excl_v` is the vector containing all the patterns from `inpt_v` to exclude for using them to compare to another pattern. If this parameter is filled, so `"sub_rtn_v"` must be empty.

`sub_rtn_v` is the vector containing all the patterns from `inpt_v` to retain for using them to compare to another pattern. If this parameter is filled, so `"sub_excl_v"` must be empty.

Examples

```
print(closer_ptrn(inpt_v=c("bonjour", "lpoerc", "nonnour", "bonnour", "nonjour", "aurevoir")

#[[1]]
#[1] "bonjour"
#
#[[2]]
#[1] "lpoerc"      "nonnour"      "bonnour"      "nonjour"      "aurevoir"
#
#[[3]]
#[1] 1 1 2 7 8
#
#[[4]]
#[1] "lpoerc"
#
#[[5]]
#[1] "bonjour"      "nonnour"      "bonnour"      "nonjour"      "aurevoir"
#
#[[6]]
#[1] 7 7 7 7 7
#
#[[7]]
#[1] "nonnour"
#
#[[8]]
#[1] "bonjour"      "lpoerc"      "bonnour"      "nonjour"      "aurevoir"
#
#[[9]]
#[1] 1 1 2 7 8
#
#[[10]]
#[1] "bonnour"
#
#[[11]]
#[1] "bonjour"      "lpoerc"      "nonnour"      "nonjour"      "aurevoir"
#
#[[12]]
#[1] 1 1 2 7 8
#
#[[13]]
#[1] "nonjour"
#
#[[14]]
#[1] "bonjour"      "lpoerc"      "nonnour"      "bonnour"      "aurevoir"
#
#[[15]]
```

```

#[1] 1 1 2 7 8
#
#[[16]]
#[1] "aurevoir"
#
#[[17]]
#[1] "bonjour" "lpoerc" "nonnour" "bonnour" "nonjour"
#
#[[18]]
#[1] 7 8 8 8 8

print(closer_ptrn(inpt_v=c("bonjour", "lpoerc", "nonnour", "bonnour", "nonjour", "aurevoir",
excl_v=c("nonnour", "nonjour"),
sub_excl_v=c("nonnour")))

#[1] 3 5
#[[1]]
#[1] "bonjour"
#
#[[2]]
#[1] "lpoerc" "bonnour" "nonjour" "aurevoir"
#
#[[3]]
#[1] 1 1 7 8
#
#[[4]]
#[1] "lpoerc"
#
#[[5]]
#[1] "bonjour" "bonnour" "nonjour" "aurevoir"
#
#[[6]]
#[1] 7 7 7 7
#
#[[7]]
#[1] "bonnour"
#
#[[8]]
#[1] "bonjour" "lpoerc" "bonnour" "nonjour" "aurevoir"
#
#[[9]]
#[1] 0 1 2 7 8
#
#[[10]]
#[1] "aurevoir"
#
#[[11]]
#[1] "bonjour" "lpoerc" "nonjour" "aurevoir"
#
#[[12]]
#[1] 0 7 8 8

```

Description

Allow to find how patterns are far or near between each other relatively to a vector containing characters at each index ("base_v"). The function gets the sum of the indexes of each pattern letter relatively to the characters in base_v. So each pattern can be compared.

Usage

```
closer_ptrn_adv(
  inpt_v,
  res = "raw_stat",
  default_val = "?",
  base_v = c(default_val, letters),
  c_word = NA
)
```

Arguments

<code>inpt_v</code>	is the input vector containing all the patterns to be analyzed
<code>res</code>	is a parameter controlling the result. If set to "raw_stat", each word in <code>inpt_v</code> will come with its score (indexes of its letters relatively to <code>base_v</code>). If set to something else, so "c_word" parameter must be filled.
<code>default_val</code>	is the value that will be added to all patterns that do not equal the length of the longest pattern in <code>inpt_v</code> . Those get this value added to make all patterns equal in length so they can be compared, defaults to "?"
<code>base_v</code>	is the vector from which all pattern get its result (letters indexes for each pattern relatively to <code>base_v</code>), defaults to <code>c("default_val", letters)</code> . "default_val" is another parameter and letters is all the western alphabetic letters in a vector
<code>c_word</code>	is a pattern from which the nearest to the farthest pattern in <code>inpt_v</code> will be compared

Examples

```
print(closer_ptrn_adv(inpt_v=c("aurevoir", "bonnour", "nonnour", "fin", "mois", "bonjour"),
  res="word", c_word="bonjour"))

#[[1]]
#[1] 1 5 15 17 38 65
#
#[[2]]
#[1] "bonjour" "bonnour" "aurevoir" "nonnour" "mois" "fin"

print(closer_ptrn_adv(inpt_v=c("aurevoir", "bonnour", "nonnour", "fin", "mois")))

#[[1]]
#[1] 117 107 119 37 64
#
#[[2]]
#[1] "aurevoir" "bonnour" "nonnour" "fin" "mois"
```

clusterizer_v	<i>clusterizer_v</i>
---------------	----------------------

Description

Allow to output clusters of elements. Takes as input a vector "inpt_v" containing a sequence of number. Can also take another vector "w_v" that has the same size of inpt_v because its elements are related to it. The way the clusters are made is related to an accuracy value which is "c_val". It means that if the difference between the values associated to 2 elements is superior to c_val, these two elements are in distinct clusters. The second element of the outputed list is the begin and end value of each cluster.

Usage

```
clusterizer_v(inpt_v, w_v = NA, c_val)
```

Arguments

inpt_v	is the vector containing the sequence of number
w_v	is the vector containing the elements related to inpt_v, defaults to NA
c_val	is the accuracy of the clusterization

Examples

```
print(clusterizer_v(inpt_v=sample.int(20, 26, replace=TRUE), w_v=NA, c_val=0.9))

# [[1]]
# [[1]] [[1]]

```

colins_datf

colins_datf

Description

Allow to insert vectors into a dataframe.

Usage

```
colins_datf(inpt_datf, target_col = list(), target_pos = list())
```

Arguments

<code>inpt_datf</code>	is the dataframe where vectors will be inserted
<code>target_col</code>	is a list containing all the vectors to be inserted
<code>target_pos</code>	is a list containing the vectors made of the columns names or numbers where the associated vectors from <code>target_col</code> will be inserted after

Examples

```

datf1 <- data.frame("frst_col"=c(1:5), "scd_col"=c(5:1))

print(colins_datf(inpt_datf=datf1, target_col=list(c("oui", "oui", "oui", "non", "non"),
  c("u", "z", "z", "z", "u")),
  target_pos=list(c("frst_col", "scd_col"), c("scd_col"))))

```

```
#   first_col cur_col scd_col cur_col.1 cur_col
#1      1      oui      5      oui      u
#2      2      oui      4      oui      z
#3      3      oui      3      oui      z
#4      4      non      2      non      z
#5      5      non      1      non      u

print(colins_datf(inpt_datf=datf1, target_col=list(c("oui", "oui", "oui", "non", "non"),
  c("u", "z", "z", "z", "u")),
  target_pos=list(c(1, 2), c("first_col"))))

#   first_col cur_col scd_col cur_col cur_col
#1      1      oui      5      u      oui
#2      2      oui      4      z      oui
#3      3      oui      3      z      oui
#4      4      non      2      z      non
#5      5      non      1      u      non
```

col_converttr

*col_converttr***Description**

Allow to convert all column that may be converted to a numeric, to a numeric, see examples

Usage

```
col_converttr(inpt_datf)
```

Arguments

inpt_datf is the input dataframe

Examples

```
datf <- mtcars
datf[, 3] <- as.character(datf[, 3])
datf[, 4] <- as.character(datf[, 4])
str(datf)

'data.frame': 32 obs. of 11 variables:
 $ mpg : num  21 21 22.8 21.4 18.7 18.1 14.3 24.4 22.8 19.2 ...
 $ cyl : num   6  6  4  6  8  6  8  4  4  6 ...
 $ disp: chr  "160" "160" "108" "258" ...
 $ hp  : chr  "110" "110" "93" "110" ...
 $ drat: num   3.9 3.9 3.85 3.08 3.15 2.76 3.21 3.69 3.92 3.92 ...
 $ wt  : num   2.62 2.88 2.32 3.21 3.44 ...
 $ qsec: num   16.5 17 18.6 19.4 17 ...
 $ vs  : num    0  0  1  1  0  1  0  1  1  1 ...
 $ am  : num    1  1  1  0  0  0  0  0  0  0 ...
 $ gear: num    4  4  4  3  3  3  3  4  4  4 ...
 $ carb: num    4  4  1  1  2  1  4  2  2  4 ...
```

```
datf <- col_converttr(inpt_datf = datf)

all(datf == mtcars)

[1] TRUE
```

col_to_row

col_to_row

Description

Allow to reverse a dataframe (cols become rows and rows become cols)

Usage

```
col_to_row(inpt_datf)
```

Arguments

inpt_datf is the inout dataframe

Examples

```
datf_test <- data.frame(c(1:11), c(11:1))

print(col_to_row(inpt_datf = datf_test))

  X1 X2 X3 X4 X5 X6 X7 X8 X9 X10 X11
1  1  2  3  4  5  6  7  8  9  10  11
2 11 10  9  8  7  6  5  4  3  2  1
```

converter_date

converter_date

Description

Allow to convert any date like second/minute/hour/day/month/year to either second, minute...year. The input date should not necessarily have all its time units (second, minute...) but all the time units according to a format. Example: "snhdmy" is for second, hour, minute, day, month, year. And "mdy" is for month, day, year.

Usage

```
converter_date(inpt_date, convert_to, frmt = "snhdmy", sep_ = "-")
```

Arguments

- `inpt_date` is the input date
- `convert_to` is the time unit the input date will be converted ("s", "n", "h", "d", "m", "y")
- `frmt` is the format of the input date
- `sep_` is the separator of the input date. For example this input date "12-07-2012" has "-" as a separator

Examples

```
print(converter_date(inpt_date="14-04-11-2024", sep_="-", frmt="hdmy", convert_to="m"))  
#[1] 24299.15  
  
print(converter_date(inpt_date="14-04-11-2024", sep_="-", frmt="hdmy", convert_to="y"))  
#[1] 2024.929  
  
print(converter_date(inpt_date="14-04-11-2024", sep_="-", frmt="hdmy", convert_to="s"))  
#[1] 63900626400  
  
print(converter_date(inpt_date="63900626400", sep_="-", frmt="s", convert_to="y"))  
#[1] 2024.929  
  
print(converter_date(inpt_date="2024", sep_="-", frmt="y", convert_to="s"))  
#[1] 63873964800
```

<code>converter_format</code>	<i><code>converter_format</code></i>
-------------------------------	--------------------------------------

Description

Allow to convert a format to another

Usage

```
converter_format(inpt_val, sep_ = "-", inpt_frmt, frmt, default_val = "00")
```

Arguments

- `inpt_val` is the input value that is linked to the format
- `sep_` is the separator of the value in `inpt_val`
- `inpt_frmt` is the format of the input value
- `frmt` is the format you want to convert to
- `default_val` is the default value given to the units that are not present in the input format

Examples

```
print(converter_format(inpt_val="23-12-05-1567", sep="-",
                      inpt_frmt="shmy", frmt="snhdmy", default_val="00"))

#[1] "23-00-12-00-05-1567"

print(converter_format(inpt_val="23-12-05-1567", sep="-",
                      inpt_frmt="shmy", frmt="Pnhdmy", default_val="00"))

#[1] "00-00-12-00-05-1567"
```

cost_and_taxes	<i>cost_and_taxes</i>
----------------	-----------------------

Description

Allow to calculate basic variables related to cost and taxes from a bunch of products (elements). So put every variable you know in the following order:

Usage

```
cost_and_taxes(
  qte = NA,
  pu = NA,
  prix_ht = NA,
  tva = NA,
  prix_ttc = NA,
  prix_tva = NA,
  pu_ttc = NA,
  adjust = NA,
  prix_d_ht = NA,
  prix_d_ttc = NA,
  pu_d = NA,
  pu_d_ttc = NA
)
```

Arguments

qte	is the quantity of elements
pu	is the price of a single elements without taxes
prix_ht	is the duty-free price of the whole set of elements
tva	is the percentage of all taxes
prix_ttc	is the price of all the elements with taxes
prix_tva	is the cost of all the taxes
pu_ttc	is the price of a single element taxes included
adjust	is the discount percentage
prix_d_ht	is the free-duty price of an element after discount
prix_d_ttc	is the price with taxes of an element after discount
pu_d	is the price of a single element after discount and without taxes
pu_d_ttc	is the free-duty price of a single element after discount

Examples

```
print(cost_and_taxes(pu=45, prix_ttc=2111, qte=23))

# [1] 23.000000 45.000000 45.000000 1.039614 2111.000000 1076.000000
#[7] 45.000000 NA NA NA NA NA
```

cumulated_rows	<i>cumulated_rows</i>
----------------	-----------------------

Description

Output a vector of size that equals to the rows number of the input dataframe, with TRUE value at the indices corresponding to the row where at least a cell of any column is equal to one of the values inputed in values_v

Usage

```
cumulated_rows(inpt_datf, values_v = c())
```

Arguments

inpt_datf	is the input data.frame
values_v	is a vector containing all the values that a cell has to equal to return a TRUE value in the output vector at the index corresponding to the row of the cell

Examples

```
datf_teste <- data.frame(c(1:10), c(10:1))

print(datf_teste)

  c.1.10. c.10.1.
1      1      10
2      2       9
3      3       8
4      4       7
5      5       6
6      6       5
7      7       4
8      8       3
9      9       2
10     10       1

print(cumulated_rows(inpt_datf = datf_teste, values_v = c(2, 3)))

[1] FALSE TRUE TRUE FALSE FALSE FALSE FALSE TRUE TRUE FALSE
```

cumulated_rows_na	<i>cumulated_rows_na</i>
-------------------	--------------------------

Description

Output a vector of size that equals to the rows number of the input dataframe, with TRUE value at the indices corresponding to the row where at least a cell of any column is equal to NA.

Usage

```
cumulated_rows_na(inpt_datf)
```

Arguments

`inpt_datf` is the input data.frame

Examples

```
datf_teste <- data.frame(c(1, 2, 3, 4, 5, NA, 7), c(10, 9, 8, NA, 7, 6, NA))
print(datf_teste)

  c.1..2..3..4..5..NA..7. c.10..9..8..NA..7..6..NA.
1                        1                        10
2                        2                         9
3                        3                         8
4                        4                        NA
5                        5                         7
6                       NA                         6
7                        7                        NA

print(cumulated_rows_na(inpt_datf = datf_teste))

[1] FALSE FALSE FALSE  TRUE FALSE  TRUE  TRUE
```

cutr_v	<i>cutr_v</i>
--------	---------------

Description

Allow to reduce all the elements in a vector to a defined size of nchar

Usage

```
cutr_v(inpt_v, until = "min")
```

Arguments

`inpt_v` is the input vector

`until` is the maximum size of nchar authorized by an element, defaults to "min", it means the shortest element in the list

Examples

```
test_v <- c("oui", "nonon", "ez", "aa", "a", "dsfsdsds")

print(cutr_v(inpt_v=test_v, until="min"))

#[1] "o" "n" "e" "a" "a" "d"

print(cutr_v(inpt_v=test_v, until=3))

#[1] "oui" "non" "ez" "aa" "a" "dsf"
```

cut_v

cut_v

Description

Allow to convert a vector to a dataframe according to a separator.

Usage

```
cut_v(inpt_v, sep_ = "")
```

Arguments

inpt_v	is the input vector
sep_	is the separator of the elements in inpt_v, defaults to ""

Examples

```
print(cut_v(inpt_v=c("oui", "non", "oui", "non")))

#      X.o. X.u. X.i.
#oui "o" "u" "i"
#non "n" "o" "n"
#oui "o" "u" "i"
#non "n" "o" "n"

print(cut_v(inpt_v=c("ou-i", "n-on", "ou-i", "n-on"), sep_="-"))

#      X.ou. X.i.
#ou-i "ou" "i"
#n-on "n" "on"
#ou-i "ou" "i"
#n-on "n" "on"
```

data_gen	<i>data_gen</i>
----------	-----------------

Description

Allo to generate in a csv all kind of data you can imagine according to what you provide

Usage

```
data_gen(
  type_ = c("number", "mixed", "string"),
  strt_l = c(0, 0, 10),
  nb_r = c(50, 10, 40),
  output = NA,
  properties = c("1-5", "1-5", "1-5"),
  type_distri = c("random", "random", "random"),
  str_source = c("a", "b", "c", "d", "e", "f", "g", "h", "i", "j", "k", "l", "m",
    "o", "p", "q", "r", "s", "t", "u", "w", "x", "y", "z"),
  round_l = c(0, 0, 0),
  sep_ = ",",
)
```

Arguments

type_	is a vector. Its arguments designates a column, a column can be made of numbers ("number"), string ("string") or both ("mixed")
strt_l	is a vector containing for each column the row from which the data will begin to be generated
nb_r	is a vector containing for each column, the number of row full from generated data
output	is the name of the output csv file, defaults to NA so no csv will be outputted by default
properties	is linked to type_distri because it is the parameters ("min_val-max_val") for "random type", ("u-x") for the poisson distribution, ("u-d") for gaussian distribution
type_distri	is a vector which, for each column, associate a type of distribution ("random", "poisson", "gaussian"), it means that not only the number but also the length of the string will be randomly generated according to these distribution laws
str_source	is the source (vector) from which the character creating random string are (default set to the occidental alphabet)
round_l	is a vector which, for each column containing number, associate a round value, if the type of the value is numeric
sep_	is the separator used to write data in the csv

Value

new generated data in addition to saving it in the output

Examples

```

print(data_gen())

#   X1   X2   X3
#1   4   2  <NA>
#2   2   4  <NA>
#3   5   2  <NA>
#4   2 abcd  <NA>
#5   4 abcd  <NA>
#6   2   4  <NA>
#7   2  abc  <NA>
#8   4  abc  <NA>
#9   4   3  <NA>
#10  4  abc  abcd
#11  5 <NA>  abc
#12  4 <NA>  abc
#13  1 <NA>  ab
#14  1 <NA> abcde
#15  2 <NA>  abc
#16  4 <NA>   a
#17  1 <NA>  abcd
#18  4 <NA>  ab
#19  2 <NA>  abcd
#20  3 <NA>  ab
#21  3 <NA>  abcd
#22  2 <NA>   a
#23  4 <NA>  abc
#24  1 <NA>  abcd
#25  4 <NA>  abc
#26  4 <NA>  ab
#27  2 <NA>  abc
#28  5 <NA>  ab
#29  3 <NA>  abc
#30  5 <NA>  abcd
#31  2 <NA>  abc
#32  2 <NA>  abc
#33  1 <NA>  ab
#34  5 <NA>   a
#35  4 <NA>  ab
#36  1 <NA>  ab
#37  1 <NA> abcde
#38  5 <NA>  abc
#39  4 <NA>  ab
#40  5 <NA> abcde
#41  2 <NA>  ab
#42  3 <NA>  ab
#43  2 <NA>  ab
#44  4 <NA>  abcd
#45  5 <NA>  abcd
#46  3 <NA>  abcd
#47  2 <NA>  abcd
#48  3 <NA>  abcd
#49  3 <NA>  abcd
#50  4 <NA>   a

print(data_gen(strt_l=c(0, 0, 0), nb_r=c(5, 5, 5)))

```

```
# X1 X2 X3
#1 2 a abc
#2 3 abcde ab
#3 4 abcde a
#4 1 3 abc
#5 3 a abcd
```

data_mesgup

data_mesgup

Description

Allow to automatically arrange 1 dimensional data according to vector and parameters

Usage

```
data_mesgup(
  data,
  cols = NA,
  file_ = NA,
  sep_ = ";",
  organisation = c(2, 1, 0),
  unic_sep1 = "_",
  unic_sep2 = "-"
)
```

Arguments

data	is the data provided (vector) each column is separated by a unic separator and each dataset from the same column is separated by another unic separator (ex: <code>c("", c("d", "-", "e", "-", "f"), "", c("a", "a1", "-", "b", "-", "c", "c1"), "_")</code>)
cols	are the colnames of the data generated in a csv
file_	is the file to which the data will be outputed, defaults to NA which means that the functio will return the dataframe generated and won't write it to a csv file
sep_	is the separator of the csv outputed
organisation	is the way variables include themselves, for instance ,resuming precedent example, if organisation=c(1, 0) so the data output will be: d, a d, a1 e, c f, c f, c1
unic_sep1	is the unic separator between variables (default is "_")
unic_sep2	is the unic separator between datasets (default is "-")

Examples

```
print(data_mesgup(data=c("_", c("-", "d", "-", "e", "-", "f"), "_",
  c("-", "a", "a1", "-", "B", "r", "uy", "-", "c", "c1"), "_"), organisation=c(1, 0)))

# X1 X2
#1 d a
#2 d a1
#3 e B
```

```
#4 e r
#5 e uy
#6 f c
#7 f c1
```

date_addr	<i>date_addr</i>
-----------	------------------

Description

Allow to add or subtract two dates that have the same time unit or not

Usage

```
date_addr(  
  date1,  
  date2,  
  add = FALSE,  
  frmt1,  
  frmt2 = frmt1,  
  sep_ = "-",  
  convert_to = "dmy"  
)
```

Arguments

- date1 is the date from which the second date will be added or subtracted
- date2 is the date that will be added or will subtract date1
- add equals to FALSE if you want date1 - date2 and TRUE if you want date1 + date2
- frmt1 is the format of date1 (snhdmy) (second, minute, hour, day, monthn year)
- frmt2 is the format of date2 (snhdmy)
- sep_ is the separator of date1 and date2
- convert_to is the format of the outputed date

Examples

```
print(date_addr(date1="25-02", date2="58-12-08", frmt1="dm", frmt2="shd", sep_="-",  
  convert_to="dmy"))  
  
#[1] "18-2-0"  
  
print(date_addr(date1="25-02", date2="58-12-08", frmt1="dm", frmt2="shd", sep_="-",  
  convert_to="dmy", add=TRUE))  
  
#[1] "3-3-0"  
  
print(date_addr(date1="25-02-2024", date2="1-01", frmt1="dmy", frmt2="dm", sep_="-",  
  convert_to="dmy", add=TRUE))  
  
#[1] "27-3-2024"
```

```

print(date_addr(date1="25-02-2024", date2="1-01", frmt1="dmy", frmt2="dm", sep_="-",
               convert_to="dmy", add=False))

#[1] "23-1-2024"

print(date_addr(date1="25-02-2024", date2="1-01", frmt1="dmy", frmt2="dm", sep_="-",
               convert_to="n", add=False))

#[1] "1064596320"

print(date_addr(date1="25-02-2024", date2="1-01", frmt1="dmy", frmt2="dm", sep_="-",
               convert_to="s", add=False))

#[1] "63875779200"

```

```

date_converter_reverse
      date_converter_reverse

```

Description

Allow to convert single date value like 2025.36 year to a date like second/minutehour/day/month/year (snhdmy)

Usage

```
date_converter_reverse(inpt_date, convert_to = "dmy", frmt = "y", sep_ = "-")
```

Arguments

inpt_date	is the input date
convert_to	is the date format the input date will be converted
frmt	is the time unit of the input date
sep_	is the separator of the outputed date

Examples

```

print(date_converter_reverse(inpt_date="2024.929", convert_to="hmy", frmt="y", sep_="-"))

#[1] "110-11-2024"

print(date_converter_reverse(inpt_date="2024.929", convert_to="dmy", frmt="y", sep_="-"))

#[1] "4-11-2024"

print(date_converter_reverse(inpt_date="2024.929", convert_to="hdmy", frmt="y", sep_="-"))

#[1] "14-4-11-2024"

print(date_converter_reverse(inpt_date="2024.929", convert_to="dhym", frmt="y", sep_="-"))

```

```
#[1] "4-14-2024-11"
```

<code>datf_appendr</code>	<i>datf_appendr</i>
---------------------------	---------------------

Description

Allow to append all columns of a dataframe in a vector.

Usage

```
datf_appendr(inpt_datf)
```

Arguments

`inpt_datf` is the input dataframe

Examples

```
datf_teste <- data.frame("col1" = c(1:5), "col2" = c(5:1))

print(datf_appendr(inpt_datf = datf_teste))

[1] 1 2 3 4 5 5 4 3 2 1
```

<code>datf_appendr2</code>	<i>datf_appendr2</i>
----------------------------	----------------------

Description

Allow to append all columns of a dataframe in a vector, specifying the column types ("integer" or "character"), see examples

Usage

```
datf_appendr2(inpt_datf, chs_type = "integer")
```

Arguments

`inpt_datf` is the inout dataframe

Examples

```
datf_teste <- data.frame("col1" = c(1:5), "col2" = c(5:1),
  "col3" = c("oui", "oui", "oui", "non", "non"))

print(datf_appendr2(inpt_datf = datf_teste, chs_type = "integer"))

[1] 1 2 3 4 5 5 4 3 2 1

print(datf_appendr2(inpt_datf = datf_teste, chs_type = "character"))

[1] "oui" "oui" "oui" "non" "non"
```

datf_insertr	<i>datf_insertr</i>
--------------	---------------------

Description

Insert rows after certain indexes, see examples

Usage

```
datf_insertr(inpt_datf, ids_vec, val_l)
```

Arguments

inpt_datf	is the input dataframe
ids_vec	is the ids where the rows has to be inserted after
val_l	is a list containing all the rows (vector) to be inserted, linked to every index within ids_vec

Examples

```
datf <- data.frame(c(1:4), c(4:1))
print(datf)

  c.1.4. c.4.1.
1      1      4
2      2      3
3      3      2
4      4      1

print(datf_insertr(inpt_datf = datf, ids_vec = c(1, 3), val_l = list(c("non", "non"), c("oui", "oui"))))

  c.1.4. c.4.1.
1      1      4
2     non    non
21      2      3
3      3      2
5     oui    oui
4      4      1

print(datf_insertr(inpt_datf = datf, ids_vec = c(1, 3), val_l = list(c("non", "non"))))
```

	c.1.4.	c.4.1.
1	1	4
2	non	non
21	2	3
3	3	2
5	non	non
4	4	1

datf_row_appendr	<i>datf_row_appendr</i>
------------------	-------------------------

Description

Allow to append all rows of a dataframe in a vector.

Usage

```
datf_row_appendr(inpt_datf)
```

Arguments

`inpt_datf` is the input dataframe

Examples

```
datf_teste <- data.frame("col1" = c(1:5), "col2" = c(5:1))
print(datf_appendr(inpt_datf = datf_teste))
```

col1	col2	col1	col2	col1	col2	col1	col2	col1	col2
1	5	2	4	3	3	4	2	5	1

datf_row_appendr2	<i>datf_row_appendr2</i>
-------------------	--------------------------

Description

Allow to append all rows of a dataframe in a vector, specifying the column types ("integer" or "character"), see examples

Usage

```
datf_row_appendr2(inpt_datf, chs_type = "integer")
```

Arguments

`inpt_datf` is the inout dataframe

Examples

```
datf_teste <- data.frame("col1" = c(1:5), "col2" = c(5:1),
  "col3" = c("oui", "oui", "oui", "non", "non"))

print(datf_row_appendr2(inpt_datf = datf_teste, chs_type = "integer"))

NULL

print(datf_row_appendr2(inpt_datf = datf_teste, chs_type = "character"))

col1 col2 col3 col1 col2 col3 col1 col2 col3 col1 col2 col3 col1
"1" "5" "oui" "2" "4" "oui" "3" "3" "oui" "4" "2" "non" "5"
col2 col3
"1" "non"
```

dcr_untl	<i>dcr_untl</i>
----------	-----------------

Description

Allow to get the final value of a incremental or decremental loop.

Usage

```
dcr_untl(strt_val, cr_val, stop_val = 0)
```

Arguments

- strt_val is the start value
- cr_val is the incremental (or decremental value)
- stop_val is the value where the loop has to stop

Examples

```
print(dcr_untl(strt_val=50, cr_val=-5, stop_val=5))

#[1] 9

print(dcr_untl(strt_val=50, cr_val=5, stop_val=450))

#[1] 80
```

dcr_val	<i>dcr_val</i>
---------	----------------

Description

Allow to get the end value after an incremental (or decremental loop)

Usage

```
dcr_val(strt_val, cr_val, stop_val = 0)
```

Arguments

strt_val	is the start value
cr_val	is the incremental or decremental value
stop_val	is the value the loop has to stop

Examples

```
print(dcr_val(strt_val=50, cr_val=-5, stop_val=5))
#[1] 5
print(dcr_val(strt_val=47, cr_val=-5, stop_val=5))
#[1] 7
print(dcr_val(strt_val=50, cr_val=5, stop_val=450))
#[1] 450
print(dcr_val(strt_val=53, cr_val=5, stop_val=450))
#[1] 448
```

depth_pairs_findr	<i>depth_pairs_findr</i>
-------------------	--------------------------

Description

Takes the pair vector as an input and associate to each pair a level of depth, see examples

Usage

```
depth_pairs_findr(inpt)
```

Arguments

inpt	is the pair vector
------	--------------------

Examples

```
print(depth_pairs_findr(c(1, 1, 2, 3, 3, 4, 4, 2, 5, 6, 7, 7, 6, 5)))

[1] 1 1 1 2 2 2 2 1 1 2 3 3 2 1
```

diff_datf

*diff_datf***Description**

Returns a vector with the coordinates of the cell that are not equal between 2 dataframes (row, column).

Usage

```
diff_datf(datf1, datf2)
```

Arguments

datf1	is an an input dataframe
datf2	is an an input dataframe

Examples

```
datf1 <- data.frame(c(1:6), c("oui", "oui", "oui", "oui", "oui", "oui"), c(6:1))

datf2 <- data.frame(c(1:7), c("oui", "oui", "oui", "oui", "non", "oui", "zz"))

print(diff_datf(datf1=datf1, datf2=datf2))

#[1] 5 1 5 2
```

dynamic_idx_converter

*dynamic_idx_converter***Description**

Allow to convert the indices of vector ('from_v_ids') which are related to the each characters of a vector (from_v_val), to fit the newly established characters of the vector from_v_val, see examples.

Usage

```
dynamic_idx_converter(from_v_ids, from_v_val)
```

Arguments

`from_v_ids` is the input vector of indices

`from_v_val` is the input vector of elements, or just the total number of characters of the elementsq in the vector

Examples

```
print(dynamic_idx_converttr(from_v_ids = c(1, 5), from_v_val = c("oui", "no", "ouI")))

[1] 1 2

print(dynamic_idx_converttr(from_v_ids = c(1, 6), from_v_val = c("oui", "no", "ouI")))

[1] 1 3
```

edm_arrangr	<i>edm_arranger</i>
-------------	---------------------

Description

Arranges data according to the values of a variable, see examples

Usage

```
edm_arrangr(inpt_datf, col_order, top_n = 10, decreasing = TRUE)
```

Arguments

`inpt_datf` is the input dataframe

`col_order` is the column names or the column number of the variable that will be used to arrange data

`top_n` is the top values

Examples

```
print(edm_arrangr(inpt_datf = mtcars, col_order = "wt", top_n = 15, decreasing = FALSE))
```

edm_arrangr2

edm_arranger2

Description

Same as `edm_arrangr` but takes in count power like numbers for the values of the variable used to arrange the data.

Usage

```
edm_arrangr2(inpt_datf, col_order, top_n = 10, decreasing = TRUE)
```

Arguments

<code>inpt_datf</code>	is the input dataframe
<code>col_order</code>	is the column names or the column number of the variable that will be used to arrange data
<code>top_n</code>	is the top values

Examples

```
print(edm_arrangr2(inpt_datf = mtcars, col_order = "wt", top_n = 15, decreasing = FALSE))
```

edm_group_by1

edm_group_by1

Description

Performs a group by (different algorithm than `edm_group_by2`), see examples

Usage

```
edm_group_by1(inpt_datf, grp_v = c())
```

Arguments

`inpt_datf` is the input dataframe

`grp_v` is the vector containiong the column names or the column numbers to perform the group by, see examples

Examples

```
datf <- data.frame("col1" = c("A", "B", "B", "A", "C", "B"),
                  "col2" = c("E", "R", "E", "E", "R", "R"),
                  "col3" = c("P", "P", "O", "O", "P", "O"))

print(datf)

  col1 col2 col3
1    A    E    P
2    B    R    P
3    B    E    O
4    A    E    O
5    C    R    P
6    B    R    O
```

```
print(edm_group_by1(inpt_datf = datf, grp_v = c("col1")))
```

	col1	col2	col3
1	A	E	P
4	A	E	O
2	B	R	P
3	B	E	O
6	B	R	O
5	C	R	P

```
print(edm_group_by1(inpt_datf = datf, grp_v = c("col1", "col2")))
```

6    B    R    O
5    C    R    P
```

```
print(edm_group_by2(inpt_datf = datf, grp_v = c("col2", "col1")))
```

```
  col2 col1 col3
1    E    A    P
4    E    A    O
3    E    B    O
2    R    B    P
6    R    B    O
5    R    C    P
```

Description

Calculates margins and critical path of tasks based on PERT algorithm. The first tasks must be at the top of the input dataframe, see examples.

Usage

```
edm_pert(inpt_datf)
```

Arguments

`inpt_datf` is the input dataframe which contains all the tasks, their duration, their finish date at the earliest/latest and their antecedent, so the `inpt_datf` must contain 5 columns see examples

Examples

```
datf <- data.frame("task" = toupper(letters[1:7]),
  "duration" = c(2, 8, 5, 2, 6, 5, 3),
  "antecedent" = c(NA, NA, "A", "B", "B", "E", "A,D"),
  "earliest" = c(2, 8, 19, 10, 14, 19, 19),
  "latest" = c(14, 8, 19, 16, 14, 19, 19))
```

```
print(datf)
```

	task	duration	antecedent	earliest	latest
1	A	2	<NA>	2	14
2	B	8	<NA>	8	8
3	C	5	A	19	19
4	D	2	B	10	16
5	E	6	B	14	14
6	F	5	E	19	19
7	G	3	A,D	19	19

```
print(edm_pert(inpt_datf = datf))
```

```

```

edm_pivot_longer1 *edm_pivot_longer1*

Description

Performs a pivot longer on dataframe, see examples. The synthax for variables must be value_id-modalitie_var1.modalitie_var2...

Usage

```
edm_pivot_longer1(
  inpt_datf,
  col_vars = c(),
  col_vars_to = c(),
  null_value = c(0),
  nvr_here = "?"
)
```

Arguments

`inpt_datf` is the input dataframe

`col_vars` is a vector containing the column names or column numbers of the variables

`col_vars_to` is a vector containing the varaiables to which will be assign the modalities, see examples

`individual_col` is the column name or the column number of the individuals

Examples

```
datf <- data.frame("individuals" = c(1, 2, 3),
  c(1, 2, 3),
  c(6, 0, 2),
  c(7, 0, 0),
  c(0, 0, 0),
  c(1, 0, 4),
  c(3, 0, 8),
  c(9, 0, 0),
  c(11, 0, 5))

colnames(datf)[2:ncol(datf)] <- c("val1-A.R",
  "val1-A.T",
  "val1-B.R",
  "val1-B.T",
  "val2-A.R",
  "val2-A.T",
  "val2-B.R",
  "val2-B.T")

datf2 <- data.frame("individuals" = c(1, 2, 3),
  c(7, 0, 2),
  c(1, 0, 4),
  c(9, 0, 8),
```

```

      c(11, 22, 5))

edm_pivot_longer2 *edm_pivot_longer2*

Description

Performs a pivot longer on dataframe keeping the null values, see examples. The syntax for variables must be value_id-modalitie_var1.modalitie_var2...

Usage

```
edm_pivot_longer2(inpt_datf, col_vars = c(), col_vars_to = c())
```

Arguments

`inpt_datf` is the input dataframe

`col_vars` is a vector containing the column names or column numbers of the variables

`col_vars_to` is a vector containing the variables to which will be assign the modalities, see examples

`individual_col` is the column name or the column number of the individuals

Examples

```
datf <- data.frame("individuals" = c(1, 2, 3),
                  c(1, 2, 3),
                  c(6, 0, 2),
                  c(7, 0, 0),
                  c(0, 0, 0),
                  c(1, 0, 4),
                  c(3, 0, 8),
                  c(9, 0, 0),
                  c(11, 0, 5))

colnames(datf)[2:ncol(datf)] <- c("val1-A.R",
                                "val1-A.T",
                                "val1-B.R",
                                "val1-B.T",
                                "val2-A.R",
                                "val2-A.T",
                                "val2-B.R",
                                "val2-B.T")

datf2 <- data.frame("individuals" = c(1, 2, 3),
                  c(7, 0, 2),
                  c(1, 0, 4),
                  c(9, 0, 8),
                  c(11, 22, 5))

edm_pivot_series *edm_pivot_series*

Description

Allow to create a new column for the value of the chosen columns at each new value of the column that represents the time. The occurrence of each time stamp has to be equal, see examples (if not consider performing the `time_serie_equalizer` function from the same package)

Usage

```
edm_pivot_series(inpt_datf, time_col, col_v = NULL)
```

Arguments

`inpt_datf` is the input dataframe
`time_col` is the column name or number of the dataframe
`col_v` is a vector containing all the column numbers or names of the variables, if null all the column will be considered as variables apart from the column designated in `time_col`

Examples

```
print(cur_datf)
```

edm_pivot_wider1 *edm_pivot_wider1*

Description

Performs a pivot wider to a dataframe, see examples.

Usage

```
edm_pivot_wider1(inpt_datf, col_vars = c(), col_vals = c(), individual_col)
```

Arguments

<code>inpt_datf</code>	is the input dataframe
<code>col_vars</code>	is a vector containig the column names or column numbers of the variables to pivot
<code>col_vals</code>	is a vector containing the column numbers or column names of the values to pivot
<code>individual_col</code>	is the column name or column number of the individuals

Examples

```

datf2 <- data.frame("individual" = c(1, 1, 1, 2, 3, 3),
                    "var1" = c("A", "A", "B", "B", "B", "A"),
                    "val1" = c(6, 7, 1, 0, 4, 2),
                    "val2" = c(3, 9, 11, 22, 5, 8))

edm_pivot_wider2 *edm_pivot_wider2*

Description

Performs a pivot wider to a dataframe with a different algorithm than `edm_pivot_wider`, see examples.

Usage

```
edm_pivot_wider2(inpt_datf, col_vars = c(), col_vals = c(), individual_col)
```

Arguments

`inpt_datf` is the input dataframe

`col_vars` is a vector containig the column names or column numbers of the variables to pivot

`col_vals` is a vector containing the column numbers or column names of the values to pivot

`individual_col` is the column name or column number of the individuals

Examples

```
datf2 <- data.frame("individual" = c(1, 1, 1, 2, 3, 3),
                    "var1" = c("A", "A", "B", "B", "B", "A"),
                    "val1" = c(6, 7, 1, 0, 4, 2),
                    "val2" = c(3, 9, 11, 22, 5, 8))
datf <- data.frame("individual" = c(1, 1, 1, 2, 3, 3),
                   "var1" = c("A", "A", "B", "B", "B", "A"),
                   "var2" = c("R", "T", "T", "R", "T", "R"),
                   "val1" = c(6, 7, 1, 0, 4, 2),
                   "val2" = c(3, 9, 11, 22, 5, 8))

print(datf)
```

```
  individual var1 var2 val1 val2
1          1   A   R    6    3
2          1   A   T    7    9
3          1   B   T    1   11
4          2   B   R    0   22

```

elements_equalifier

elements_equalifier

Description

Takes an input vector with elements that have different occurrence, and output a vector with all these elements with the same number of occurrence, see examples

Usage

```
elements_equalifier(inpt_v, until = 3)
```

Arguments

- inpt_v
- is the input vector
- until
- is how many times each elements will be in the output vector

Examples

```
print(elements_equalifier(letters, until = 2))

[1] "a" "b" "c" "d" "e" "f" "g" "h" "i" "j" "k" "l" "m" "n" "o" "p" "q" "r" "s"
[20] "t" "u" "v" "w" "x" "y" "z" "a" "b" "c" "d" "e" "f" "g" "h" "i" "j" "k" "l"
[39] "m" "n" "o" "p" "q" "r" "s" "t" "u" "v" "w" "x" "y" "z"

print(elements_equalifier(c(letters, letters[-1]), until = 2))

[1] "a" "b" "c" "d" "e" "f" "g" "h" "i" "j" "k" "l" "m" "n" "o" "p" "q" "r" "s"
[20] "t" "u" "v" "w" "x" "y" "z" "b" "c" "d" "e" "f" "g" "h" "i" "j" "k" "l" "m"
[39] "n" "o" "p" "q" "r" "s" "t" "u" "v" "w" "x" "y" "z" "a"
```

equalizer_v

equalizer_v

Description

Takes a vector of character as an input and returns a vector with the elements at the same size. The size can be chosen via depth parameter.

Usage

```
equalizer_v(inpt_v, depth = "max", default_val = "?")
```

Arguments

inpt_v	is the input vector containing all the characters
depth	is the depth parameter, defaults to "max" which means that it is equal to the character number of the element(s) in inpt_v that has the most
default_val	is the default value that will be added to the output characters if those has an inferior length (characters) than the value of depth

Examples

```
print(equalizer_v(inpt_v=c("aa", "zzz", "q"), depth=2))

#[1] "aa" "zz" "q?"

print(equalizer_v(inpt_v=c("aa", "zzz", "q"), depth=12))

#[1] "aa???????????" "zzz???????????" "q?????????????"
```

extract_normal	<i>extract_normal</i>
----------------	-----------------------

Description

Allow to extract values that fits a normal distribution from any kind of dataset, see examples and parameters

Usage

```
extract_normal(
  inpt_datf,
  mean,
  sd,
  accuracy,
  round_value = 1,
  normalised = FALSE,
  n = NA,
  tries = 3
)
```

Arguments

inpt_datf	is the input dataset as a dataframe, values/modalities are in the first column and frequency (not normalised) is in the second column
mean	is the mean of the target normal distribution
sd	is the standard deviation of the target normal distribution
accuracy	is how much of a difference between the points of the targeted normal distribution and the actual points is tolerated
round_value	is the round value for the normal distribution used under the hood to compare the dataset and extract the best points, defaults to 1
normalised	is if the input frequency is divided by n, if TRUE the parameter n must be filled
n	is the number of points
tries	is how many normal distributions are used under the hood to compare their points to the those in the input dataset, defaults to 3. The higher it is, the higher the number of different points from the input dataset will be in accordance for the normal distribution the function tries to build from the dataset. It does not increase by a lot but can be non-negligible and note that the higher the number of tries is, the higher the execution time of the function will be.

Examples

```
sample_val <- round(rnorm(n = 72000, mean = 12, sd = 2), 1)
sample_freq <- unique_total(sample_val)
sample_qual <- infinite_char_seq(n = length(sample_freq))
datf_test <- data.frame(sample_qual, sample_freq)
n <- nrow(datf_test)
print(datf_test)

sample_qual sample_freq

```

extrt_only_v	<i>extrt_only_v</i>
--------------	---------------------

Description

Returns the elements from a vector "inpt_v" that are in another vector "pttrn_v"

Usage

```
extrt_only_v(inpt_v, pttrn_v)
```

Arguments

inpt_v	is the input vector
pttrn_v	is the vector contining all the elements that can be in inpt_v

Examples

```

print(extrt_only_v(inpt_v=c("oui", "non", "peut", "oo", "ll", "oui", "non", "oui", "oui"),
  pttrn_v=c("oui")))

#[1] "oui" "oui" "oui" "oui"

```

fillr	<i>fillr</i>
-------	--------------

Description

Allow to fill a vector by the last element n times

Usage

```
fillr(inpt_v, ptrn_fill = "\\.\.\.\.\d")
```

Arguments

`inpt_v` is the input vector

`ptrn_fill` is the pattern used to detect where the function has to fill the vector by the last element n times. It defaults to "...\\d" where "\\d" is the regex for an int value. So this parameter has to have "\\d" which designates n.

Examples

```
print(fillr(c("a", "b", "...3", "c")))

#[1] "a" "b" "b" "b" "b" "c"
```

<code>fixer_nest_v</code>	<i><code>fixer_nest_v</code></i>
---------------------------	----------------------------------

Description

Return the elements of a vector "wrk_v" (1) that corresponds to the pattern of elements in another vector "cur_v" (2) according to another vector "ptrn_v" (3) that contains the pattern of elements.

Usage

```
fixer_nest_v(cur_v, ptrn_v, wrk_v)
```

Arguments

`cur_v` is the input vector

`ptrn_v` is the vector containing all the patterns that may be contained in `cur_v`

`wrk_v` is a vector containing all the indexes of `cur_v` taken in count in the function

Examples

```
print(fixer_nest_v(cur_v=c("oui", "non", "peut-etre", "oui", "non", "peut-etre"),
  ptrn_v=c("oui", "non", "peut-etre"),
  wrk_v=c(1, 2, 3, 4, 5, 6)))

#[1] 1 2 3 4 5 6

print(fixer_nest_v(cur_v=c("oui", "non", "peut-etre", "oui", "non", "peut-etre"),
  ptrn_v=c("oui", "non"),
  wrk_v=c(1, 2, 3, 4, 5, 6)))

#[1] 1 2 NA 4 5 NA
```

`fold_rec`*fold_rec*

Description

Allow to get all the files recursively from a path according to an end and start depth value. If you want to have an other version of this function that uses a more sophisticated algorithm (which can be faster), check `file_rec2`. Depth example: if i have `dir/dir2/dir3`, `dir/dir2b/dir3b`, i have a depth equal to 3

Usage

```
fold_rec(xmax, xmin = 1, pathc = ".")
```

Arguments

<code>xmax</code>	is the end depth value
<code>xmin</code>	is the start depth value
<code>pathc</code>	is the reference path

`fold_rec2`*fold_rec2*

Description

Allow to find the directories and the subdirectories with a specified end and start depth value from a path. This function might be more powerfull than `file_rec` because it uses a custom algorithm that does not need to perform a full recursive search before tuning it to only find the directories with a good value of depth. Depth example: if i have `dir/dir2/dir3`, `dir/dir2b/dir3b`, i have a depth equal to 3

Usage

```
fold_rec2(xmax, xmin = 1, pathc = ".")
```

Arguments

<code>xmax</code>	is the depth value
<code>xmin</code>	is the minimum value of depth
<code>pathc</code>	is the reference path, from which depth value is equal to 1

format_date	<i>format_date</i>
-------------	--------------------

Description

Allow to convert xx-month-xxxx date type to xx-xx-xxxx

Usage

```
format_date(f_dialect, sentc, sep_in = "-", sep_out = "-")
```

Arguments

f_dialect	are the months from the language of which the month come
sentc	is the date to convert
sep_in	is the separator of the dat input (default is "-")
sep_out	is the separator of the converted date (default is "-")

Examples

```
print(format_date(f_dialect=c("janvier", "février", "mars", "avril", "mai", "juin",
"juillet", "aout", "septembre", "octobre", "novembre", "décembre"), sentc="11-septembre-2
#[1] "11-09-2023"
```

geo_min	<i>geo_min</i>
---------	----------------

Description

Return a dataframe containing the nearest geographical points (row) according to established geographical points (column).

Usage

```
geo_min(inpt_datf, established_datf)
```

Arguments

inpt_datf	is the input dataframe of the set of geographical points to be classified, its firts column is for latitude, the second for the longitude and the third, if exists, is for the altitude. Each point is one row.
established_datf	is the dataframe containing the coordiantes of the established geographical points

Examples

```
in_ <- data.frame(c(11, 33, 55), c(113, -143, 167))

in2_ <- data.frame(c(12, 55), c(115, 165))

print(geo_min(inpt_datf=in_, established_datf=in2_))

#           X1           X2
#1    245.266         NA
#2 24200.143         NA
#3           NA 127.7004

in_ <- data.frame(c(51, 23, 55), c(113, -143, 167), c(6, 5, 1))

in2_ <- data.frame(c(12, 55), c(115, 165), c(2, 5))

print(geo_min(inpt_datf=in_, established_datf=in2_))

#           X1           X2
#1           NA 4343.720
#2 26465.63         NA
#3           NA 5825.517
```

get_rec	<i>get_rec</i>
---------	----------------

Description

Allow to get the value of directorie depth from a path.

Usage

```
get_rec(pathc = ".")
```

Arguments

pathc	is the reference path example: if i have dir/dir2/dir3, dir/dir2b/dir3b, i have a depth equal to 3
-------	--

<i>globe</i>	<i>globe</i>
--------------	--------------

Description

Allow to calculate the distances between a set of geographical points and another established geographical point. If the altitude is not filled, so the result returned won't take in count the altitude.

Usage

```
globe(lat_f, long_f, alt_f = NA, lat_n, long_n, alt_n = NA)
```

Arguments

lat_f	is the latitude of the established geographical point
long_f	is the longitude of the established geographical point
alt_f	is the altitude of the established geographical point, defaults to NA
lat_n	is a vector containing the latitude of the set of points
long_n	is a vector containing the longitude of the set of points
alt_n	is a vector containing the altitude of the set of points, defaults to NA

Examples

```
print(globe(lat_f=23, long_f=112, alt_f=NA, lat_n=c(2, 82), long_n=c(165, -55), alt_n=NA))

#[1] 6342.844 7059.080

print(globe(lat_f=23, long_f=112, alt_f=8, lat_n=c(2, 82), long_n=c(165, -55), alt_n=c(8, 10),
            group_v=c("O", "-", "-", "u", "i", "-", "n", "o", "-", "-", "-", "zz", "/", "/")))

#[1] 6342.844 7059.087
```

glue_groupv	<i>glue_groupv</i>
-------------	--------------------

Description

Takes an input vector and returns the same vector unlike that certain elements will be glued as an unique element according to those designated in a special vector, see examples.

Usage

```
glue_groupv(inpt_v, group_v = c(), until)
```

Arguments

inpt_v	is the input vector
is	a vector containing all the elements that will be glued in the output vector

Examples

```
print(glue_groupv(inpt_v = c("o", "-", "-", "u", "i", "-", "n", "o", "-", "-", "-", "zz", "/", "/"),
                  group_v = c("-", "/")))

[1] "o"  "--" "u"  "i"  "-"  "n"  "o"  "---" "zz" "/"

print(glue_groupv(inpt_v = c("o", "-", "-", "u", "i", "-", "n", "o", "-", "-", "-", "zz", "/", "/"),
                  group_v = c("-", "/"), until = 3))

[1] "o"  "--" "u"  "i"  "-"  "n"  "o"  ---  "-"  "zz" "/"

print(glue_groupv(inpt_v = c("o", "-", "-", "u", "i", "-", "n", "o", "-", "-", "-", "zz", "/", "/"),
                  group_v = c("-", "/"), until = 2))

[1] "o"  "--" "u"  "i"  "-"  "n"  "o"  --  --  "zz" "/"
```

 grep_all

grep_all

Description

Allow to perform a grep function on multiple input elements

Usage

```
grep_all(inpt_v, pattern_v)
```

Arguments

inpt_v is the input vectors to grep elements from
 pattern_v is a vector containing the patterns to grep

Examples

```
print(grep_all(inpt_v = c(1:14, "z", 1:7, "z", "a", "z"),
               pattern_v = c("z", "4")))

[1] 15 23 25 4 14 19

print(grep_all(inpt_v = c(1:14, "z", 1:7, "z", "a", "z"),
               pattern_v = c("z", "^4$")))

[1] 15 23 25 4 19

print(grep_all(inpt_v = c(1:14, "z", 1:7, "z", "a", "z"),
               pattern_v = c("z")))

[1] 15 23 25
```

 grep_all2

grep_all2

Description

Performs the grep_all function with another algorithm, potentially faster

Usage

```
grep_all2(inpt_v, pattern_v)
```

Arguments

inpt_v is the input vectors to grep elements from
 pattern_v is a vector containing the patterns to grep

Examples

```
print(grep_all2(inpt_v = c(1:14, "z", 1:7, "z", "a", "z"),
               pattern_v = c("z", "4")))

[1] 15 23 25  4 14 19

print(grep_all2(inpt_v = c(1:14, "z", 1:7, "z", "a", "z"),
               pattern_v = c("z", "^4$")))

[1] 15 23 25  4 19

print(grep_all2(inpt_v = c(1:14, "z", 1:7, "z", "a", "z"),
               pattern_v = c("z")))

[1] 15 23 25
```

groupr_datf	<i>groupr_datf</i>
-------------	--------------------

Description

Allow to create groups from a dataframe. Indeed, you can create conditions that lead to a flag value for each cell of the input dataframe according to the cell value. This function is based on `see_datf` and `nestr_datf2` functions.

Usage

```
groupr_datf(
  inpt_datf,
  condition_lst,
  val_lst,
  conjunction_lst,
  rtn_val_pos = c()
)
```

Arguments

<code>inpt_datf</code>	is the input dataframe
<code>condition_lst</code>	is a list containing all the condition as a vector for each group
<code>val_lst</code>	is a list containing all the values associated with <code>condition_lst</code> as a vector for each group
<code>conjunction_lst</code>	is a list containing all the conjunctions associated with <code>condition_lst</code> and <code>val_lst</code> as a vector for each group
<code>rtn_val_pos</code>	is a vector containing all the group flag value like this ex: <code>c("flag1", "flag2", "flag3")</code>

Examples

```

interactive()

datf1 <- data.frame(c(1, 2, 1), c(45, 22, 88), c(44, 88, 33))

val_lst <- list(list(c(1), c(1)), list(c(2)), list(c(44, 88)))

condition_lst <- list(c(">", "<"), c("%%", c("==", "=="))

conjunction_lst <- list(c("|"), c(), c("|"))

rtn_val_pos <- c("+", "++", "+++")

print(groupr_datf(inpt_datf=datf1, val_lst=val_lst, condition_lst=condition_lst,
conjunction_lst=conjunction_lst, rtn_val_pos=rtn_val_pos))

#      X1  X2  X3
#1 <NA>   +  +++
#2    ++  ++  +++
#3 <NA> +++   +

```

gsub_mult

gsub_mult

Description

Performs a gsub operation with n patterns and replacements.

Usage

```
gsub_mult(inpt_v, pattern_v = c(), replacement_v = c())
```

Arguments

inpt_v is a vector containing all the elements that contains expressions to be substituted

pattern_v is a vector containing all the patterns to be substituted in any elements of inpt_v

replacement_v is a vector containing the expression that are going to substitute those provided by pattern_v

Examples

```

print(gsub_mult(inpt_v = c("X and Y programming languages are great", "More X, more X!"),
  pattern_v = c("X", "Y", "Z"),
  replacement_v = c("C", "R", "GO")))
[1] "C and R programming languages are great"
[2] "More C, more C!"

```

historic_sequence1 *historic_sequence1*

Description

Allow to perform a pivot wider on a sequential dataset (here the type is dataframe), each variable will be duplicated in a column to show the value to this variable at $n - 1$ for each individual, see examples.

Usage

```
historic_sequence1(inpt_datf, bf_ = 1)
```

Arguments

`inpt_datf` is the input dataframe
`bf_` is the number of previous value of the individual it will search for, see examples

Examples

```
set.seed(123)
var1 <- round(runif(n = 14, min = 100, max = 122))
set.seed(123)
var2 <- round(runif(n = 14, min = 14, max = 20))

datf <- data.frame("ids" = c(20, 20, 20, 20, 19, 19, 19, 18, 18, 18, 18,
                             17, 17, 17),
                  "individual" = c("oui", "non", "peut1", "peut2",
                                   "oui", "peut1", "peut2"),
                  "var1" = var1,
                  "var2" = var2)

print(datf)
```

	ids	individual	var1	var2

how_normal

how_normal

Description

Allow to get how much a sequence of numbers fit a normal distribution with chosen parameters, see examples

Usage

```
how_normal(inpt_datf, normalised = TRUE, mean = 0, sd = 1)
```

Arguments

inpt_datf	is the input dataframe containing all the values in the first column and their frequency (normalised or no), in the second column
normalised	is a boolean, takes TRUE if the frequency for each value is divided by n, FALSE if not
mean	is the mean of the normal distribution that the dataset tries to fit
sd	is the standard deviation of the normal distribution the dataset tries to fit

Examples

```
sample_val <- round(rnorm(n = 12000, mean = 6, sd = 1.25), 1)
sample_freq <- unique_total(sample_val)
datf_test <- data.frame(unique(sample_val), sample_freq)
print(datf_test)
```

how_unif

how_unif

Description

Allow to see how much a sequence of numbers fit a uniform distribution, see examples

Usage

```
how_unif(inpt_v, normalised = TRUE)
```

Arguments

normalised is a boolean, takes TRUE if the frequency for each value is divided by n, FALSE if not

inpt_datf is the input dataframe containing all the values in the first column and their frequencyu at the second column

Examples

```
sample_val <- round(runif(n = 12000, min = 24, max = 27), 1)
sample_freq <- unique_total(sample_val)
datf_test <- data.frame(unique(sample_val), sample_freq)
```

```
print(datf_test)
```

```
  unique.sample_val. sample_freq
1             24.4           400
2             24.8           379
3             25.5           414

[1] 0.7797352

```

id_keepr

id_keepr

Description

Allow to get the original indexes after multiple equality comparison according to the original number of row

Usage

```
id_keepr(inpt_datf, col_v = c(), el_v = c(), rstr_l = NA)
```

Arguments

inpt_datf	is the input dataframe
col_v	is the vector containing the column numbers or names to be compared to their respective elements in "el_v"
el_v	is a vector containing the elements that may be contained in their respective column described in "col_v"
rstr_l	is a list containing the vector composed of the indexes of the elements chosen for each comparison. If the length of the list is inferior to the lenght of comparisons, so the last vector of rstr_l will be the same as the last one to fill make rstr_l equal in term of length to col_v and el_v

Examples

```

datf1 <- data.frame(c("oui", "oui", "oui", "non", "oui"),
  c("opui", "op", "op", "zez", "zez"), c(5:1), c(1:5))

print(id_keepr(inpt_datf=datf1, col_v=c(1, 2), el_v=c("oui", "op")))

#[1] 2 3

print(id_keepr(inpt_datf=datf1, col_v=c(1, 2), el_v=c("oui", "op"),

```

```

      rstr_l=list(c(1:5), c(3, 2, 2, 2, 3)))

#[1] 2 3

print(id_keepr(inpt_datf=datf1, col_v=c(1, 2), el_v=c("oui", "op"),
      rstr_l=list(c(1:5), c(3))))

#[1] 3

print(id_keepr(inpt_datf=datf1, col_v=c(1, 2), el_v=c("oui", "op"), rstr_l=list(c(1:5))))

#[1] 2 3

```

incr_fillr

incr_fillr

Description

Take a vector uniquely composed by double and sorted ascendingly, a step, another vector of elements whose length is equal to the length of the first vector, and a default value. If an element of the vector is not equal to its predecessor minus a user defined step, so these can be the output according to the parameters (see example):

Usage

```
incr_fillr(inpt_v, wrk_v = NA, default_val = NA, step = 1)
```

Arguments

inpt_v	is the asending double only composed vector
wrk_v	is the other vector (size equal to inpt_v), defaults to NA
default_val	is the default value put when the difference between two following elements of inpt_v is greater than step, defaults to NA
step	is the allowed difference between two elements of inpt_v

Examples

```

print(incr_fillr(inpt_v=c(1, 2, 4, 5, 9, 10),
      wrk_v=NA,
      default_val="increasing"))

#[1] 1 2 3 4 5 6 7 8 9 10

print(incr_fillr(inpt_v=c(1, 1, 2, 4, 5, 9),
      wrk_v=c("ok", "ok", "ok", "ok", "ok"),
      default_val=NA))

#[1] "ok" "ok" "ok" NA "ok" "ok" NA NA NA

print(incr_fillr(inpt_v=c(1, 2, 4, 5, 9, 10),
      wrk_v=NA,
      default_val="NAN"))

```

```
#[1] "1" "2" "NAN" "4" "5" "NAN" "NAN" "NAN" "9" "10"
```

```
infinite_char_seq infinite_char_seq
```

Description

Allow to generate an infinite sequence of unique letters

Usage

```
infinite_char_seq(n, base_char = letters)
```

Arguments

`n` is how many sequence of numbers will be generated
`base_char` is the vector containing the elements from which the sequence is generated

Examples

```
print(infinite_char_seq(28))

[1] "a" "b" "c" "d" "e" "f" "g" "h" "i" "j" "k" "l" "m" "n" "o"
[16] "p" "q" "r" "s" "t" "u" "v" "w" "x" "y" "a" "aa" "ab"
```

```
inner_all inner_all
```

Description

Allow to apply inner join on n dataframes, datatables, tibble

Usage

```
inner_all(..., keep_val = FALSE, id_v)
```

Arguments

`...` are all the dataframes etc
`keep_val` is if you want to keep the id column
`id_v` is the common id of all the dataframes etc

Examples

```

datf1 <- data.frame(
  "id1"=c(1:5),
  "var1"=c("oui", "oui", "oui", "non", "non")
)

datf2 <- data.frame(
  "id1"=c(1, 2, 3, 7, 9),
  "var1"=c("oui2", "oui2", "oui2", "non2", "non2")
)

print(inner_all(datf1, datf2, keep_val=FALSE, id_v="id1"))

id1 var1.x var1.y
1    1    oui   oui2
2    2    oui   oui2
3    3    oui   oui2

```

insert_datf	<i>insert_datf</i>
-------------	--------------------

Description

Allow to insert dataframe into another dataframe according to coordinates (row, column) from the dataframe that will be inserted

Usage

```
insert_datf(datf_in, datf_ins, ins_loc)
```

Arguments

datf_in	is the dataframe that will be inserted
datf_ins	is the dataset to be inserted
ins_loc	is a vector containg two parameters (row, column) of the beginning for the insertion

Examples

```

datf1 <- data.frame(c(1, 4), c(5, 3))

datf2 <- data.frame(c(1, 3, 5, 6), c(1:4), c(5, 4, 5, "ereer"))

print(insert_datf(datf_in=datf2, datf_ins=datf1, ins_loc=c(4, 2)))

#   c.1..3..5..6. c.1.4. c.5..4..5...ereer..
# 1              1      1                   5
# 2              3      2                   4
# 3              5      3                   5
# 4              6      1                   5

print(insert_datf(datf_in=datf2, datf_ins=datf1, ins_loc=c(3, 2)))

```

```
#   c.1..3..5..6. c.1.4. c.5..4..5...ereer..
# 1              1      1                      5
# 2              3      2                      4
# 3              5      1                      5
# 4              6      4                      3

print(insert_datf(datf_in=datf2, datf_ins=datf1, ins_loc=c(2, 2)))

#   c.1..3..5..6. c.1.4. c.5..4..5...ereer..
# 1              1      1                      5
# 2              3      1                      5
# 3              5      4                      3
# 4              6      4                      ereer
```

intersect_all	<i>intersect_all</i>
---------------	----------------------

Description

Allows to calculate the intersection between n vectors

Usage

```
intersect_all(...)
```

Arguments

... is all the vector you want to calculate the intersection from

Examples

```
print(intersect_all(c(1:5), c(1, 2, 3, 6), c(1:4)))

[1] 1 2 3
```

intersect_mod	<i>intersect_mod</i>
---------------	----------------------

Description

Returns the mods that have elements in common

Usage

```
intersect_mod(datf, inter_col, mod_col, n_min, descndly_ordered = NA)
```

Arguments

`datf` is the input dataframe

`inter_col` is the column name or the column number of the values that may be commun between the different mods

`mod_col` is the column name or the column number of the mods in the dataframe

`n_min` is the minimum elements in common a mod should have to be taken in count

`ordered_descendly` in case that the elements in commun are numeric, this option can be enabled by giving a value of TRUE or FALSE see examples

Examples

```
datf <- data.frame("col1"=c("oui", "oui", "oui", "oui", "oui", "oui",
                             "non", "non", "non", "non", "ee", "ee", "ee"), "col2"=c(1:6, 2:5, 1:6))

print(intersect_mod(datf=datf, inter_col=2, mod_col=1, n_min=2))

  col1 col2
2   oui   2
3   oui   3
7  non   2
8  non   3
12  ee   2
13  ee   3

print(intersect_mod(datf=datf, inter_col=2, mod_col=1, n_min=3))

  col1 col2
2   oui   2
3   oui   3
4   oui   4
5   oui   5
7  non   2
8  non   3
9  non   4
10 non   5

print(intersect_mod(datf=datf, inter_col=2, mod_col=1, n_min=5))

  col1 col2
1   oui   1
2   oui   2
3   oui   3
4   oui   4
5   oui   5
6   oui   6

datf <- data.frame("col1"=c("non", "non", "oui", "oui", "oui", "oui",
                             "non", "non", "non", "non", "ee", "ee", "ee"), "col2"=c(1:6, 2:5, 1:6))

print(intersect_mod(datf=datf, inter_col=2, mod_col=1, n_min=3))

  col1 col2
8  non   3
9  non   4
```

```

10 non    5
3  oui    3
4  oui    4
5  oui    5

```

```
intersect_mod2      intersect_mod2
```

Description

Returns the mods that have elemnts in common, uses a different algorithm than intersect_mod1, see examples

Usage

```
intersect_mod2(inpt_datf, inter_col, mod_col, n_min = 1)
```

Arguments

inpt_datf	is the input dataframe
inter_col	is the column number or name of the elements that may be in common to each mod
mod_col	is the column number or name of the mods
n_min	is the minimum number of elements in common each mod have to have to be outputed in the returned dataframe

Examples

```

datf <- data.frame("country" = c("Germany", "France", "Italy", "France", "Germany", "Italy"),
                  "year" = c(2000, 2000, 2001, 2002, 2003, 2004),
                  "random_value" = c(1, 3, 2, 1, 2, 2))
print(datf)

```

```

  country year random_value
1 Germany 2000             1
2  France 2000             3
3   Italy 2001             2
4  France 2002             1
5 Germany 2003             2
6   Italy 2004             2

```

```
print(intersect_mod2(inpt_datf = datf, inter_col = "year", mod_col = "country"))
```

```

  country year random_value
1 Germany 2000             1
2  France 2000             3

```

inter_max

inter_max

Description

Takes as input a list of vectors composed of ints or floats ascendly ordered (intervals) that can have a different step to one of another element ex: list(c(0, 2, 4), c(0, 4), c(1, 2, 2.3)). The function will return the list of lists altered according to the maximum step found in the input list.

Usage

```
inter_max(inpt_l, max_ = -1000, get_lst = TRUE)
```

Arguments

inpt_l	is the input list
max_	is a value you are sure is the minimum step value of all the sub-lists
get_lst	is the parameter that, if set to True, will keep the last values of vectors in the return value if the last step exceeds the end value of the vector.

Examples

```
print(inter_max(inpt_l=list(c(0, 2, 4), c(0, 4), c(1, 2, 2.3)), get_lst=TRUE))

#[[1]]
#[1] 0 4
#
#[[2]]
#[1] 0 4
#
#[[3]]
#[1] 1.0 2.3

print(inter_max(inpt_l=list(c(0, 2, 4), c(0, 4), c(1, 2, 2.3)), get_lst=FALSE))

# [[1]]
#[1] 0 4
#
#[[2]]
#[1] 0 4
#
#[[3]]
#[1] 1
```

inter_min	<i>inter_min</i>
-----------	------------------

Description

Takes as input a list of vectors composed of ints or floats ascendly ordered (intervals) that can have a different step to one of another element ex: `list(c(0, 2, 4), c(0, 4), c(1, 2, 2.3))`. This function will return the list of vectors with the same steps preserving the begin and end value of each interval. The way the algorithm searches the common step of all the sub-lists is also given by the user as a parameter, see `how_to` paramaters.

Usage

```
inter_min(
  inpt_l,
  min_ = 1000,
  sensi = 3,
  sensi2 = 3,
  how_to_op = c("divide"),
  how_to_val = c(3)
)
```

Arguments

<code>inpt_l</code>	is the input list containing all the intervals
<code>min_</code>	is a value you are sure is superior to the maximum step value in all the intervals
<code>sensi</code>	is the decimal accuracy of how the difference between each value <code>n</code> to <code>n+1</code> in an interval is calculated
<code>sensi2</code>	is the decimal accuracy of how the value with the common step is calculated in all the intervals
<code>how_to_op</code>	is a vector containing the operations to perform to the pre-common step value, defaults to only "divide". The operations can be "divide", "subtract", "multiply" or "add". All type of operations can be in this parameter.
<code>how_to_val</code>	is a vector containing the value relatives to the operations in <code>hot_to_op</code> , defaults to 3 output from ex:

Examples

```
print(inter_min(inpt_l=list(c(0, 2, 4), c(0, 4), c(1, 2, 2.3))))

# [[1]]
# [1] 0.0 0.1 0.2 0.3 0.4 0.5 0.6 0.7 0.8 0.9 1.0 1.1 1.2 1.3 1.4 1.5 1.6 1.7 1.8
# [20] 1.9 2.0 2.1 2.2 2.3 2.4 2.5 2.6 2.7 2.8 2.9 3.0 3.1 3.2 3.3 3.4 3.5 3.6 3.7
# [39] 3.8 3.9 4.0
#
# [[2]]
# [1] 0.0 0.1 0.2 0.3 0.4 0.5 0.6 0.7 0.8 0.9 1.0 1.1 1.2 1.3 1.4 1.5 1.6 1.7 1.8
# [20] 1.9 2.0 2.1 2.2 2.3 2.4 2.5 2.6 2.7 2.8 2.9 3.0 3.1 3.2 3.3 3.4 3.5 3.6 3.7
# [39] 3.8 3.9 4.0
#
# [[3]]
```

```
# [1] 1.0 1.1 1.2 1.3 1.4 1.5 1.6 1.7 1.8 1.9 2.0 2.1 2.2 2.3
```

isnt_divisible	<i>isnt_divisible</i>
----------------	-----------------------

Description

Takes a vector as an input and returns all the elements that are not divisible by all choosen numbers from another vector.

Usage

```
isnt_divisible(inpt_v = c(), divisible_v = c())
```

Arguments

inpt_v	is the input vector
divisible_v	is the vector containing all the numbers that will try to divide those contained in inpt_v

Examples

```
print(isnt_divisible(inpt_v=c(1:111), divisible_v=c(2, 4, 5)))

# [1] 1 3 7 9 11 13 17 19 21 23 27 29 31 33 37 39 41 43 47
# [20] 49 51 53 57 59 61 63 67 69 71 73 77 79 81 83 87 89 91 93
# [39] 97 99 101 103 107 109 111
```

is_divisible	<i>is_divisible</i>
--------------	---------------------

Description

Takes a vector as an input and returns all the elements that are divisible by all choosen numbers from another vector.

Usage

```
is_divisible(inpt_v = c(), divisible_v = c())
```

Arguments

inpt_v	is the input vector
divisible_v	is the vector containing all the numbers that will try to divide those contained in inpt_v

Examples

```
print(is_divisible(inpt_v=c(1:111), divisible_v=c(2, 4, 5)))

#[1] 20 40 60 80 100
```

join_n_lvl

join_n_lvl

Description

Allow to see the progress of the multi-level joins of the different variables modalities. Here, multi-level joins is a type of join that usually needs a concatenation of two or more variables to make a key. But here, there is no need to proceed to a concatenation. See examples.

Usage

```
join_n_lvl(first_datf, scd_datf, join_type = c(), lst_pair = list())
```

Arguments

first_datf	is the first data.frame (table)
scd_datf	is the second data.frame (table)
join_type	is a vector containing all the join type ("left", "inner", "right") for each variable
lst_pair	is a lis of vectors. The vectors refers to a multi-level join. Each vector should have a length of 1. Each vector should have a name. Its name refers to the column name of multi-level variable and its value refers to the column name of the join variable.

Examples

```
datf3 <- data.frame("vil"=c("one", "one", "one", "two", "two", "two"),
                    "charac"=c(1, 2, 2, 1, 2, 2),
                    "rev"=c(1250, 1430, 970, 1630, 2231, 1875),
                    "vil2" = c("one", "one", "one", "two", "two", "two"),
                    "idl2" = c(1:6))
datf4 <- data.frame("vil"=c("one", "one", "one", "two", "two", "three"),
                    "charac"=c(1, 2, 2, 1, 1, 2),
                    "rev"=c(1.250, 1430, 970, 1630, 593, 456),
                    "vil2" = c("one", "one", "one", "two", "two", "two"),
                    "idl2" = c(2, 3, 1, 5, 5, 5))

print(join_n_lvl(first_datf=datf3, scd_datf=datf4, lst_pair=list(c("charac" = "vil"), c("v
                    join_type=c("inner", "left"))))
```

```
[1] "pair: charac vil"
| | 0%
1
|= | 50%
2
|==| 100%
[1] "pair: vil2 idl2"
```

```
| | 0%

<code>just_anything</code>	<i>just_anything</i>
----------------------------	----------------------

Description

Extract only the letters from all elements of a vector, see examples

Usage

```
just_anything(inpt_v, symbol_ = "-", anything_v = c())
```

Arguments

- `inpt_v` is the input vector
- `symbol_` is the chosen symbol to replace numbers

Examples

```
print(just_anything(inpt_v = c("oui222jj644", "oui122jj"),
symbol_ = "-", anything_v = letters))

[1] "oui-jj-" "oui-jj"
```

<code>just_anything2</code>	<i>just_anything2</i>
-----------------------------	-----------------------

Description

Extract only the letters from all elements of a vector, see examples

Usage

```
just_anything2(inpt_v, symbol_ = "-", anything_v = c())
```

Arguments

`inpt_v` is the input vector
`symbol_` is the chosen symbol to replace numbers

Examples

```
print(just_anything2(inpt_v = c("oui222jj44", "oui122jj"),
  symbol_ = "-", anything_v = letters))

[1] "oui---jj--" "oui---jj"
```

<code>just_anything3</code>	<i>just_anything3</i>
-----------------------------	-----------------------

Description

Extract only the letters from all elements of a vector, see examples

Usage

```
just_anything3(inpt_v, anything_v = c())
```

Arguments

`inpt_v` is the input vector

Examples

```
print(just_anything3(inpt_v = c("oui222jj644", "oui122jj"),
  anything_v = letters))

[1] "oui jj" "oui jj"
```

<code>just_chr</code>	<i>just_chr</i>
-----------------------	-----------------

Description

Extract only the letters from all elements of a vector, see examples

Usage

```
just_chr(inpt_v, symbol_ = "-")
```

Arguments

`inpt_v` is the input vector
`symbol_` is the chosen symbol to replace numbers

Examples

```
print(just_chr(inpt_v = c("oui222jj644", "oui122jj"),
  symbol_ = "-"))

[1] "oui-jj-" "oui-jj"
```

just_chr2

just_chr2

Description

Extract only the letters from all elements of a vector, see examples

Usage

```
just_chr2(inpt_v, symbol_ = "-")
```

Arguments

inpt_v is the input vector
symbol_ is the chosen symbol to replace numbers

Examples

```
print(just_chr2(inpt_v = c("oui222jj44", "oui122jj"),
  symbol_ = "-"))

[1] "oui---jj--" "oui---jj"
```

just_chr3

just_chr3

Description

Extract only the letters from all elements of a vector, see examples

Usage

```
just_chr3(inpt_v)
```

Arguments

inpt_v is the input vector

Examples

```
print(just_chr3(inpt_v = c("oui222jj644", "oui122jj")))

[1] "ouiijj" "ouiijj"
```

just_nb

just_nb

Description

Extract only the letters from all elements of a vector, see examples

Usage

```
just_nb(inpt_v, symbol_ = "-")
```

Arguments

inpt_v is the input vector
symbol_ is the chosen symbol to replace numbers

Examples

```
print(just_nb(inpt_v = c("oui222jj644", "oui122jj"),
  symbol_ = "-"))

[1] "-222-44" "-122-"
```

just_nb2

just_nb2

Description

Extract only the letters from all elements of a vector, see examples

Usage

```
just_nb2(inpt_v, symbol_ = "-")
```

Arguments

inpt_v is the input vector
symbol_ is the chosen symbol to replace numbers

Examples

```
print(just_nb2(inpt_v = c("oui222jj44", "oui122jj"),
  symbol_ = "-"))

[1] "---222--44" "---122--"
```

<code>just_nb3</code>	<i><code>just_nb3</code></i>
-----------------------	------------------------------

Description

Extract only the letters from all elements of a vector, see examples

Usage

```
just_nb3(inpt_v)
```

Arguments

`inpt_v` is the input vector

Examples

```
print(just_nb3(inpt_v = c("oui222jj644", "oui122jj")))
[1] 222644 122
```

<code>just_not_anything</code>	<i><code>just_not_anything</code></i>
--------------------------------	---------------------------------------

Description

Extract only the letters from all elements of a vector, see examples

Usage

```
just_not_anything(inpt_v, symbol_ = "-", anything_v = c())
```

Arguments

`inpt_v` is the input vector
`symbol_` is the chosen symbol to replace numbers

Examples

```
print(just_not_anything(inpt_v = c("oui222jj644", "oui122jj"),
  symbol_ = "-", anything_v = letters))
[1] "-222-644" "-122-"
```

```
just_not_anything2 just_not_anything2
```

Description

Extract only the letters from all elements of a vector, see examples

Usage

```
just_not_anything2(inpt_v, symbol_ = "-", anything_v = c())
```

Arguments

inpt_v	is the input vector
symbol_	is the chosen symbol to replace numbers

Examples

```
print(just_not_anything2(inpt_v = c("oui222jj44", "oui122jj"),  
  symbol_ = "-", anything_v = letters))
```

```
[1] "---222-44" "---122--"
```

```
just_not_anything3 just_not_anything3
```

Description

Extract only the letters from all elements of a vector, see examples

Usage

```
just_not_anything3(inpt_v, anything_v = c())
```

Arguments

inpt_v	is the input vector
--------	---------------------

Examples

```
print(just_not_anything3(inpt_v = c("oui222jj644", "oui122jj"),  
  anything_v = letters))
```

```
[1] "222644" "122"
```

leap_yr	<i>leap_year</i>
---------	------------------

Description

Get if the year is leap

Usage

```
leap_yr(year)
```

Arguments

year is the input year

Examples

```
print(leap_yr(year=2024))  
  
#[1] TRUE
```

left_all	<i>left_all</i>
----------	-----------------

Description

Allow to apply left join on n dataframes, datatables, tibble

Usage

```
left_all(..., keep_val = FALSE, id_v)
```

Arguments

... are all the dataframes etc
keep_val is if you want to keep the id column
id_v is the common id of all the dataframes etc

Examples

```
datf1 <- data.frame(  
  "id1"=c(1:5),  
  "var1"=c("oui", "oui", "oui", "non", "non")  
)  
  
datf2 <- data.frame(  
  "id1"=c(1, 2, 3, 7, 9),  
  "var1"=c("oui2", "oui2", "oui2", "non2", "non2")  
)
```

```
print(left_all(datf1, datf2, datf2, datf2, keep_val=FALSE, id_v="idl"))

  idl var1.x var1.y var1.x.x var1.y.y
1   1   oui  oui2   oui2   oui2
2   2   oui  oui2   oui2   oui2
3   3   oui  oui2   oui2   oui2
4   4  non  <NA>   <NA>   <NA>
5   5  non  <NA>   <NA>   <NA>#'
print(left_all(datf1, datf2, datf2, keep_val=FALSE, id_v="idl"))

  idl var1.x var1.y var1
1   1   oui  oui2 oui2
2   2   oui  oui2 oui2
3   3   oui  oui2 oui2
4   4  non  <NA> <NA>
5   5  non  <NA> <NA>
```

letter_to_nb	<i>letter_to_nb</i>
--------------	---------------------

Description

Allow to get the number of a spreadsheet based column by the letter ex: AAA = 703

Usage

```
letter_to_nb(letter)
```

Arguments

letter is the letter (name of the column)

Examples

```
print(letter_to_nb("rty"))

#[1] 12713
```

list_files	<i>list_files</i>
------------	-------------------

Description

A list.files() based function addressing the need of listing the files with extension a or or extension b ...

Usage

```
list_files(patternc, pathc = ".")
```

Arguments

`patternc` is a vector containing all the extensions you want
`pathc` is the path, can be a vector of multiple path because `list.files()` supports it.

<code>lst_flatnr</code>	<i>lst_flatnr</i>
-------------------------	-------------------

Description

Flatten a list to a vector

Usage

```
lst_flatnr(inpt_l)
```

Arguments

`inpt_l` is the input list

Examples

```
print(lst_flatnr(inpt_l=list(c(1, 2), c(5, 3), c(7, 2, 7))))
#[1] 1 2 5 3 7 2 7
```

<code>match_by</code>	<i>match_by</i>
-----------------------	-----------------

Description

Allow to match elements by ids, see examples.

Usage

```
match_by(to_match_v = c(), inpt_v = c(), inpt_ids = c())
```

Arguments

`to_match_v` is the vector containing all the elements to match
`inpt_v` is the input vector containong all the elements that could contains the elements to match. Each elements is linked to an element from `inpt_ids` at any given index, see examples. So `inpt_v` and `inpt_ids` must be the same size
`inpt_ids` is the vector containing all the ids for the elements in `inpt_v`. An element is linked to the id `x` is both are at the same index. So `inpt_v` and `inpt_ids` must be the same size

Examples

```
print(match_by(to_match_v = c("a"), inpt_v = c("a", "z", "a", "p", "p", "e", "e", "a"),
             inpt_ids = c(1, 1, 1, 2, 2, 3, 3, 3)))

[1] 1 8

print(match_by(to_match_v = c("a"), inpt_v = c("a", "z", "a", "a", "p", "e", "e", "a"),
             inpt_ids = c(1, 1, 1, 2, 2, 3, 3, 3)))

[1] 1 4 8

print(match_by(to_match_v = c("a", "e"), inpt_v = c("a", "z", "a", "a", "p", "e", "e", "a"),
             inpt_ids = c(1, 1, 1, 2, 2, 3, 3, 3)))

[1] 1 4 8 6
```

match_na_omit	<i>match_na_omit</i>
---------------	----------------------

Description

Performs a match, but remove the NA values in the output if there is one or many, see examples.

Usage

```
match_na_omit(x, table)
```

Arguments

- x is the vector of the patterns to be matched
- table is the vector that may contain the patterns to be matched

Examples

```
match_na_omit(x = c("oui", "non", "2"), table = c("1", "oui", "oui", "ee", "non"))

[1] 2 5
```

multitud	<i>multitud</i>
----------	-----------------

Description

From a list containing vectors allow to generate a vector following this rule: list(c("a", "b"), c("1", "2"), c("A", "Z", "E")) -> c("a1A", "b1A", "a2A", "b2A", "a1Z, ...)

Usage

```
multitud(l, sep_ = "")
```

Arguments

l is the list
sep_ is the separator between elements (default is set to "" as you see in the example)

Examples

```
print(multitud(l=list(c("a", "b"), c("1", "2"), c("A", "Z", "E"), c("Q", "F")), sep="/")

#[1] "a/1/A/Q" "b/1/A/Q" "a/2/A/Q" "b/2/A/Q" "a/1/Z/Q" "b/1/Z/Q" "a/2/Z/Q"
#[8] "b/2/Z/Q" "a/1/E/Q" "b/1/E/Q" "a/2/E/Q" "b/2/E/Q" "a/1/A/F" "b/1/A/F"
#[15] "a/2/A/F" "b/2/A/F" "a/1/Z/F" "b/1/Z/F" "a/2/Z/F" "b/2/Z/F" "a/1/E/F"
#[22] "b/1/E/F" "a/2/E/F" "b/2/E/F"
```

nb2_follow	<i>nb2_follow</i>
------------	-------------------

Description

Allows to get the number and pattern of potential continuous pattern after an index of a vector, see examples

Usage

```
nb2_follow(inpt_v, inpt_idx, inpt_follow_v = c())
```

Arguments

inpt_v is the input vector
inpt_idx is the index
inpt_follow_v is a vector containing the patterns that are potentially just after inpt_nb

Examples

```
print(nb2_follow(inpt_v = c(1:12), inpt_idx = 4, inpt_follow_v = c(5)))

[1] 1 5
# we have 1 times the pattern 5 just after the 4nth index of inpt_v

print(nb2_follow(inpt_v = c(1, "non", "oui", "oui", "oui", "nop", 5), inpt_idx = 2, inpt_follow_v = c(3, "oui"))

[1] "3" "oui"

# we have 3 times continuously the pattern 'oui' and 0 times the pattern 5 just after the 2nd index of inpt_v

print(nb2_follow(inpt_v = c(1, "non", "5", "5", "5", "nop", 5), inpt_idx = 2, inpt_follow_v = c(3, "5"))

[1] "3" "5"
```

nb_follow	<i>nb_follow</i>
-----------	------------------

Description

Allow to get the number of certain patterns that may be after an index of a vector continuously, see examples

Usage

```
nb_follow(inpt_v, inpt_idx, inpt_follow_v = c())
```

Arguments

inpt_v	is the input vector
inpt_idx	is the index
inpt_follow_v	is a vector containing all the potential patterns that may follow the element in the vector at the index inpt_idx

Examples

```
print(nb_follow(inpt_v = c(1:13), inpt_idx = 6, inpt_follow_v = c(5:9)))  
[1] 3  
  
print(nb_follow(inpt_v = c("ou", "nn", "pp", "zz", "zz", "ee", "pp"), inpt_idx = 2,  
  inpt_follow_v = c("pp", "zz")))  
[1] 3
```

nb_to_letter	<i>nb_to_letter</i>
--------------	---------------------

Description

Allow to get the letter of a spreadsheet based column by the number ex: 703 = AAA

Usage

```
nb_to_letter(x)
```

Arguments

x	is the number of the column
---	-----------------------------

Examples

```
print(nb_to_letter(5))  
[1] "e"  
print(nb_to_letter(27))  
[1] "aa"  
print(nb_to_letter(51))  
[1] "ay"  
print(nb_to_letter(52))  
[1] "az"  
print(nb_to_letter(53))  
[1] "ba"  
print(nb_to_letter(675))  
[1] "yy"  
print(nb_to_letter(676))  
[1] "yz"  
print(nb_to_letter(677))  
[1] "za"  
print(nb_to_letter(702))  
[1] "zz"  
print(nb_to_letter(703))  
[1] "aaa"  
print(nb_to_letter(18211))  
[1] "zxk"  
print(nb_to_letter(18277))  
[1] "zzy"  
print(nb_to_letter(18278))  
[1] "zzz"  
print(nb_to_letter(18279))  
[1] "aaaa"
```

nestr_datf1	<i>nestr_datf1</i>
-------------	--------------------

Description

Allow to write a value (1a) to a dataframe (1b) to its cells that have the same coordinates (row and column) than the cells whose value is equal to a another special value (2a), from another another dataframe (2b). The value (1a) depends of the cell value coordinates of the third dataframe (3b). If a cell coordinates (1c) of the first dataframe (1b) does not correspond to the coordinates of a good returning cell value (2a) from the dataframe (2b), so this cell (1c) can have its value changed to the same cell coordinates value (3a) of a third dataframe (4b), if (4b) is not set to NA.

Usage

```
nestr_datf1(
  inptf_datf,
  inptt_pos_datf,
  nestr_datf,
  yes_val = TRUE,
  inptt_neg_datf = NA
)
```

Arguments

```
inptf_datf    is the input dataframe (1b)
inptt_pos_datf
               is the dataframe (2b) that corresponds to the (1a) values
nestr_datf    is the dataframe (2b) that has the special value (2a)
yes_val       is the special value (2a)
inptt_neg_datf
               is the dataframe (4b) that has the (3a) values, defaults to NA
```

Examples

```
print(nestr_datf1(inptf_datf=data.frame(c(1, 2, 1), c(1, 5, 7)),
  inptt_pos_datf=data.frame(c(4, 4, 3), c(2, 1, 2)),
  inptt_neg_datf=data.frame(c(44, 44, 33), c(12, 12, 12)),
  nestr_datf=data.frame(c(TRUE, FALSE, TRUE), c(FALSE, FALSE, TRUE)), yes_val=TRUE))

#   c.1..2..1. c.1..5..7.
#1         4         12
#2        44         12
#3         3          2

print(nestr_datf1(inptf_datf=data.frame(c(1, 2, 1), c(1, 5, 7)),
  inptt_pos_datf=data.frame(c(4, 4, 3), c(2, 1, 2)),
  inptt_neg_datf=NA,
  nestr_datf=data.frame(c(TRUE, FALSE, TRUE), c(FALSE, FALSE, TRUE)), yes_val=TRUE))

#   c.1..2..1. c.1..5..7.
```

#1	4	1
#2	2	5
#3	3	2

<i>nestr_datf2</i>	<i>nestr_datf2</i>
--------------------	--------------------

Description

Allow to write a special value (1a) in the cells of a dataframe (1b) that correspond (row and column) to whose of another dataframe (2b) that return another special value (2a). The cells whose coordinates do not match the coordinates of the dataframe (2b), another special value can be written (3a) if not set to NA.

Usage

```
nestr_datf2(inptf_datf, rtn_pos, rtn_neg = NA, nestr_datf, yes_val = T)
```

Arguments

- `inptf_datf` is the input dataframe (1b)
- `rtn_pos` is the special value (1a)
- `rtn_neg` is the special value (3a)
- `nestr_datf` is the dataframe (2b)
- `yes_val` is the special value (2a)

Examples

```
print(nestr_datf2(inptf_datf=data.frame(c(1, 2, 1), c(1, 5, 7)), rtn_pos="yes",
rtn_neg="no", nestr_datf=data.frame(c(TRUE, FALSE, TRUE), c(FALSE, FALSE, TRUE)), yes_val

# c.1..2..1. c.1..5..7.
#1      yes      no
#2      no       no
#3      yes      yes
```

<i>nest_v</i>	<i>nest_v</i>
---------------	---------------

Description

Nest two vectors according to the following parameters.

Usage

```
nest_v(f_v, t_v, step = 1, after = 1)
```

Arguments

- f_v is the vector that will welcome the nested vector t_v
- t_v is the imbriuator vector
- step defines after how many elements of f_v the next element of t_v can be put in the output
- after defines after how many elements of f_v, the begining of t_v can be put

Examples

```
print(nest_v(f_v=c(1, 2, 3, 4, 5, 6), t_v=c("oui", "oui2", "oui3", "oui4", "oui5", "oui6"),
step=2, after=2))

#[1] "1" "2" "oui" "3" "4" "oui2" "5" "6" "oui3" "oui4"
```

new_ordered	<i>new_ordered</i>
-------------	--------------------

Description

Returns the indexes of elements contained in "w_v" according to "f_v"

Usage

```
new_ordered(f_v, w_v, nvr_here = NA)
```

Arguments

- f_v is the input vector
- w_v is the vector containing the elements that can be in f_v
- nvr_here is a value you are sure is not present in f_v

Examples

```
print(new_ordered(f_v=c("non", "non", "non", "oui"), w_v=c("oui", "non", "non")))

#[1] 4 1 2
```

normal_dens	<i>normal_dens</i>
-------------	--------------------

Description

Calculates the normal distribution probability, see examples

Usage

```
normal_dens(target_v = c(), mean, sd)
```

Arguments

target_v	is the target value(s) (one or bounded), see examples
mean	is the mean of the normal distribution
sd	is the standard deviation of the normal distribution

Examples

```
print(normal_dens(target_v = 13, mean = 12, sd = 2))

[1] 0.1760327

print(normal_dens(target_v = c(9, 11), mean = 12, sd = 1.5, step = 0.01))

[1] 0.2288579

print(normal_dens(target_v = c(1, 18), mean = 12, sd = 1.5, step = 0.01))

[1] 0.9999688
```

occu	<i>occu</i>
------	-------------

Description

Allow to see the occurrence of each variable in a vector. Returns a dataframe with, as the first column, the all the unique variable of the vector and , in he second column, their occurrence respectively.

Usage

```
occu(inpt_v)
```

Arguments

inpt_v	the input dataframe
--------	---------------------

Examples

```
print(occu(inpt_v=c("oui", "peut", "peut", "non", "oui")))

#   var occurrence
#1  oui           2
#2  peut          2
#3  non           1
```

old_to_new_idx	<i>old_to_new_idx</i>
----------------	-----------------------

Description

Allow to convert index of elements in a vector `inpt_v` to index of an vector type `1:sum(nchar(inpt_v))`, see examples

Usage

```
old_to_new_idx(inpt_v = c())
```

Arguments

`inpt_v` is the input vector

Examples

```
print(old_to_new_idx(inpt_v = c("oui", "no", "eeee")))

[1] 1 1 1 2 2 3 3 3 3
```

or_bool1	<i>or_bool1</i>
----------	-----------------

Description

Returns a boolean vector according to 'or' condition on boolean vector in a dataframe, each column represents a boolean vector, see examples, uses a different algorithm than `or_bool1`

Usage

```
or_bool1(inpt_datf)
```

Examples

```
print(or_bool1(inpt_datf = data.frame("bool1" = c(TRUE, FALSE, FALSE, TRUE),
                                       "bool2" = c(TRUE, TRUE, FALSE, TRUE))))

[1] TRUE TRUE FALSE TRUE
```

or_bool2

or_bool2

Description

Returns a boolean vector according to 'or' condition on boolean vector in a dataframe, each column represents a boolean vector, see examples, uses a different algorithm than or_bool1

Usage

```
or_bool2(inpt_datf)
```

Examples

```
print(or_bool2(inpt_datf = data.frame("bool1" = c(TRUE, FALSE, FALSE, TRUE),
                                       "bool2" = c(TRUE, TRUE, FALSE, TRUE)))

[1] TRUE TRUE FALSE TRUE
```

pairs_findr

pairs_findr

Description

Takes a character as input and detect the pairs of pattern, like the parenthesis pairs if the pattern is "(" and then ")"

Usage

```
pairs_findr(inpt, ptrn1 = "(", ptrn2 = ")")
```

Arguments

inpt	is the input character
ptrn1	is the first pattern encountered in the pair
ptrn2	is the second pattern in the pair

Examples

```
print(pairs_findr(inpt="ze+(yu*45/(jk+zz)*(o())p)-(re*(rt+qs)-fg)"))

[[1]]
[1] 4 1 1 3 2 2 3 4 6 5 5 6

[[2]]
[1] 4 11 17 19 21 22 24 25 27 31 37 41
```

pairs_findr_merger *pairs_findr_merger*

Description

Takes two different outputs from pairs_findr and merge them. Can be usefull when the pairs consists in different patterns, for example one output from the pairs_findr function with ptrn1 = "(" and ptrn2 = ")", and a second output from the pairs_findr function with ptrn1 = "" and ptrn2 = "".

Usage

```
pairs_findr_merger(lst1 = list(), lst2 = list())
```

Arguments

lst1 is the first ouput from pairs findr function
 lst2 is the second ouput from pairs findr function

Examples

```
print(pairs_findr_merger(lst1=list(c(1, 2, 3, 3, 2, 1), c(3, 4, 5, 7, 8, 9)),
                        lst2=list(c(1, 1), c(1, 2))))

[[1]]
[1] 1 1 2 3 4 4 3 2

[[2]]
[1] 1 2 3 4 5 7 8 9

print(pairs_findr_merger(lst1=list(c(1, 2, 3, 3, 2, 1), c(3, 4, 5, 7, 8, 9)),
                        lst2=list(c(1, 1), c(1, 11))))

[[1]]
[1] 1 2 3 4 4 3 2 1

[[2]]
[1] 1 3 4 5 7 8 9 11

print(pairs_findr_merger(lst1=list(c(1, 2, 3, 3, 2, 1), c(3, 4, 5, 8, 10, 11)),
                        lst2=list(c(4, 4), c(6, 7))))

[[1]]
[1] 1 2 3 4 4 3 2 1

[[2]]
[1] 3 4 5 6 7 8 10 11

print(pairs_findr_merger(lst1=list(c(1, 2, 3, 3, 2, 1), c(3, 4, 5, 7, 10, 11)),
                        lst2=list(c(4, 4), c(8, 9))))

[[1]]
[1] 1 2 3 3 4 4 2 1

[[2]]
```

```

[1] 3 4 5 7 8 9 10 11

print(pairs_findr_merger(lst1=list(c(1, 2, 3, 3, 2, 1)), c(3, 4, 5, 7, 10, 11)),
      lst2=list(c(4, 4), c(18, 19))))

[[1]]
[1] 1 2 3 3 2 1 4 4

[[2]]
[1] 3 4 5 7 10 11 18 19

print(pairs_findr_merger(lst1 = list(c(1, 1, 2, 2, 3, 3)), c(2, 7, 9, 10, 11, 15)),
      lst2 = list(c(3, 2, 1, 1, 2, 3, 4, 4), c(1, 17, 18, 22, 23, 29, 29, 29)))

[[1]]
[1] 6 5 1 1 2 2 3 3 4 4 5 6 7 7

[[2]]
[1] 1 2 7 9 10 11 15 17 18 22 23 29 35 40

print(pairs_findr_merger(lst1 = list(c(1, 1)), c(22, 23)),
      lst2 = list(c(1, 1, 2, 2), c(3, 21, 27, 32))))

[[1]]
[1] 1 1 2 2 3 3

[[2]]
[1] 3 21 22 23 27 32

```

`pairs_insertr`

pairs_insertr

Description

Takes a character representing an arbitrary condition (like ReGeX for example) or an information (to a parser for example), vectors containing all the pair of pattern that potentially surrounds condition (flagged_pair_v and corr_v), and a vector containing all the conjunction character, as input and returns the character with all or some of the condition surrounded by the pair characters. See examples. All the pair characters are inserted according to the closest pair they found prioritizing those found next to the condition and on the same depth-level and , if not found, the pair found at the n+1 depth-level.

Usage

```

pairs_insertr(
  inpt,
  algo_used = c(1:3),
  flagged_pair_v = c(")", "["),
  corr_v = c("(", "["),
  flagged_conj_v = c("&", "|")
)

```

Arguments

<code>inpt</code>	is the input character representing an arbitrary condition, like ReGex for example, or information to a parser for example
<code>algo_used</code>	is a vector containing one or more of the 3 algorithms used. The first algorithm will simply put the pair of parenthesis at the condition surrounded and/or after a character flagged (in <code>flagged_conj_v</code>) as a conjunction. The second algorithm will put parenthesis at the condition that are located after other conditions that are surrounded by a pair. The third algorithm will put a pair at all the condition, it is very powerfull but takes a longer time. See examples and make experience to see which combination of algorithm(s) is the most efficient for your use case.
<code>flagged_pair_v</code>	is a vector containing all the first character of the pairs
<code>corr_v</code>	is a vector containing all the last character of the pairs
<code>flagged_conj_v</code>	is a vector containing all the conjunction character

Examples

```

print(pairs_insertr(inpt = "([one]|two|twob)three(four)", algo_used = c(1)))

[1] "([one]| [two]| [twob])three(four) "

print(pairs_insertr(inpt = "(one|[two]|twob)three(four)", algo_used = c(2)))

[1] "(one|[two]| [twob]) (three) (four) "

print(pairs_insertr(inpt = "(oneA|[one]|two|twob)three(four)", algo_used = c(1, 2)))

[1] "(oneA|[one]| [two]| [twob]) (three) (four) "

print(pairs_insertr(inpt = "(oneA|[one]|two|twob)three(four)", algo_used = c(1, 2, 3)))

[1] "([oneA]| [one]| [two]| [twob]) (three) (four) "

print(pairs_insertr(inpt = "(oneA|[one]|two|twob)three(four)", algo_used = c(3)))

[1] "([oneA]| [one]| (two) | (twob)) (three) (four) "

print(pairs_insertr(inpt = "(oneA|[one]|two|twob)three((four))", algo_used = c(3)))

[1] "([oneA]| [(one)] | (two) | (twob)) (three) ((four)) "

```

pairs_insertr2 *pairs_insertr2*

Description

Takes a character representing an arbitrary condition (like ReGeX for example) or an information (to a parser for example), vectors containing all the pair of pattern that potentially surrounds condition (flagged_pair_v and corr_v), and a vector containing all the conjunction character, as input and returns the character with all or some of the condition surrounded by the pair characters. See examples. All the pair characters are inserted according to the closest pair they found prioritizing those found next to the condition and on the same depth-level and , if not found, the pair found at the n+1 depth-level.

Usage

```
pairs_insertr2(
  inpt,
  algo_used = c(1:3),
  flagged_pair_v = c(")", "["),
  corr_v = c("(", "["),
  flagged_conj_v = c("&", "|"),
  method = c("(", ")")
)
```

Arguments

inpt	is the input character representing an arbitrary condition, like ReGex for example, or information to a parser for example
algo_used	is a vector containing one or more of the 3 algorithms used. The first algorithm will simply put the pair of parenthesis at the condition surrounded and/or after a character flagged (in flagged_conj_v) as a conjunction. The second algorithm will put parenthesis at the condition that are located after other conditions that are surrounded by a pair. The third algorithm will put a pair at all the condition, it is very powerfull but takes a longer time. See examples and make experience to see which combination of algorythm(s) is the most efficient for your use case.
flagged_pair_v	is a vector containing all the first character of the pairs
corr_v	is a vector containing all the last character of the pairs
flagged_conj_v	is a vector containing all the conjunction character
method	is length 2 vector containing as a first index, the first character of the pair inserted, and at the last index, the second and last character of the pair

Examples

```
print(pairs_insertr2(inpt = "([one]|two|twob)three(four)", algo_used = c(1), method = c(
[1] "([one]|(two)|(twob))three(four)"

print(pairs_insertr2(inpt = "([one]|two|twob)three(four)", algo_used = c(1), method = c(
```

```

[1] "([one]|[two]|[twob])three(four)"

print(pairs_insertr2(inpt = "(oneA|[one]|two|twob)three(four)", algo_used = c(1, 2)))

[1] "(oneA|[one]|(two)|(twob))(three)(four)"

print(pairs_insertr2(inpt = "(oneA|[one]|two|twob)three(four)", algo_used = c(1, 2), meth
      flagged_pair_v = c(")", "[", "#"), corr_v = c("(", "[", "-")))

[1] "(oneA|[one]|-two#|-twob#)-three#(four)"

print(pairs_insertr2(inpt = "(oneA|[one]|two|twob)three(four)", algo_used = c(1, 2, 3)))

[1] "((oneA|[one]|(two)|(twob))(three)(four)"

print(pairs_insertr2(inpt = "(oneA|[one]|two|twob)three(four)", algo_used = c(3), method

[1] "([oneA|[one]|two]|[twob])[three](four)"

print(pairs_insertr2(inpt = "(oneA|[one]|two|twob)three((four))", algo_used = c(3)))

[1] "((oneA|[one]|(two)|(twob))(three)((four))"

```

paste_datf

paste_datf

Description

Return a vector composed of pasted elements from the input dataframe at the same index.

Usage

```
paste_datf(inpt_datf, sep = "")
```

Arguments

<code>inpt_datf</code>	is the input dataframe
<code>sep</code>	is the separator between pasted elements, defaults to ""

Examples

```

print(paste_datf(inpt_datf=data.frame(c(1, 2, 1), c(33, 22, 55))))

[1] "133" "222" "155"

```

paste_datf2	<i>paste_datf2</i>
-------------	--------------------

Description

Return a vector composed of pasted elements from the input dataframe at the same column.

Usage

```
paste_datf2(inpt_datf, sep = "")
```

Arguments

inpt_datf	is the input dataframe
sep	is the separator between pasted elements, defaults to ""

Examples

```
print(paste_datf2(inpt_datf=data.frame(c(1, 2, 1), c(33, 22, 55))))
#[1] "121" "332255"
```

pattern_generator	<i>pattern_generator</i>
-------------------	--------------------------

Description

Allow to create patterns which have a part that is varying randomly each time.

Usage

```
pattern_generator(base_, from_, nb, hmn = 1, after = 1, sep = "")
```

Arguments

base_	is the pattern that will be kept
from_	is the vector from which the elements of the random part will be generated
nb	is the number of random pattern chosen for the varying part
hmn	is how many of varying pattern from the same base will be created
after	is set to 1 by default, it means that the varying part will be after the fixed part, set to 0 if you want the varying part to be before
sep	is the separator between all patterns in the returned value

Examples

```
print(pattern_generator(base_="oui", from_=c("er", "re", "ere"), nb=1, hmn=3))

# [1] "ouier" "ouire" "ouier"

print(pattern_generator(base_="oui", from_=c("er", "re", "ere"), nb=2, hmn=3, after=0, se

# [1] "er-re-o-u-i" "ere-re-o-u-i" "ere-er-o-u-i"
```

pattern_gettr

pattern_gettr

Description

Search for pattern(s) contained in a vector in another vector and return a list containing matched one (first index) and their position (second index) according to these rules: First case: Search for patterns strictly, it means that the searched pattern(s) will be matched only if the patterns contained in the vector that is being explored by the function are present like this c("pattern_searched", "other", ..., "pattern_searched") and not as c("other_thing pattern_searched other_thing", "other", ..., "pattern_searched other_thing") Second case: It is the opposite to the first case, it means that if the pattern is partially present like in the first position and the last, it will be considered like a matched pattern. REGEX can also be used as pattern

Usage

```
pattern_gettr(
  word_,
  vct,
  occ = c(1),
  strict,
  btwn,
  all_in_word = "yes",
  notatall = "###"
)
```

Arguments

word_	is the vector containing the patterns
vct	is the vector being searched for patterns
occ	a vector containing the occurrence of the pattern in word_ to be matched in the vector being searched, if the occurrence is 2 for the nth pattern in word_ and only one occurrence is found in vct so no pattern will be matched, put "forever" to no longer depend on the occurrence for the associated pattern
strict	a vector containing the "strict" condition for each nth vector in word_ ("strict" is the string to activate this option)
btwn	is a vector containing the condition ("yes" to activate this option) meaning that if "yes", all elements between two matched pattern in vct will be returned, so the patterns you enter in word_ have to be in the order you think it will appear in vct

`all_in_word` is a value (default set to "yes", "no" to activate this option) that, if activated, won't authorized a previous matched pattern to be matched again

`notatall` is a string that you are sure is not present in `vct`

Examples

```
print(pattern_gettr(word=c("oui", "non", "erer"), vct=c("oui", "oui", "non", "oui",
  "non", "opp", "opp", "erer", "non", "ok"), occ=c(1, 2, 1),
  btwn=c("no", "yes", "no"), strict=c("no", "no", "ee")))

#[[1]]
#[1] 1 5 8
#
#[[2]]
#[1] "oui" "non" "opp" "opp" "erer"
```

pattern_tuning *pattern_tuning*

Description

Allow to tune a pattern very precisely and output a vector containing its variations `n` times.

Usage

```
pattern_tuning(
  pattn,
  spe_nb,
  spe_l,
  exclude_type,
  hmn = 1,
  rg = c(1, nchar(pattn))
)
```

Arguments

`pattn` is the character that will be tuned

`spe_nb` is the number of new character that will be replaced

`spe_l` is the source vector from which the new characters will replace old ones

`exclude_type` is character that won't be replaced

`hmh` is how many output the function will return

`rg` is a vector with two parameters (index of the first letter that will be replaced, index of the last letter that will be replaced) default is set to all the letters from the source pattern

Examples

```
print(pattern_tuning(pattn="oui", spe_nb=2, spe_l=c("e", "r", "T", "O"), exclude_type="o")

#[1] "orT" "oTr" "oOi"
```

power_to_char	<i>power_to_char</i>
---------------	----------------------

Description

Convert a scientific number to a string representing normally the number.

Usage

```
power_to_char(inpt_v = c())
```

Arguments

inpt_v	is the input vector containing scientific number, but also other elements that won't be taken in count
--------	--

Examples

```
print(power_to_char(inpt_v = c(22 * 10000000, 12, 9 * 0.0000002)))
[1] "22000000000" "12" "0.00000018"
```

pre_to_post_idx	<i>pre_to_post_idx</i>
-----------------	------------------------

Description

Allow to convert indexes from a pre-vector to post-indexes based on a current vector, see examples

Usage

```
pre_to_post_idx(inpt_v = c(), inpt_idx = c(1:length(inppt_v)))
```

Arguments

inpt_v	is the new vector
inpt_idx	is the vector containing the pre-indexes

Examples

```
print(pre_to_post_idx(inpt_v = c("oui", "no", "eee"), inpt_idx = c(1:8)))
[1] 1 1 1 2 2 3 3 3
As if the first vector was c("o", "u", "i", "n", "o", "e", "e", "e")
```

ptrn_switchr	<i>ptrn_switchr</i>
--------------	---------------------

Description

Allow to switch, copy pattern for each element in a vector. Here a pattern is the values that are separated by a same separator. Example: "xx-xxx-xx" or "xx/xx/xxxx". The xx like values can be swiched or copied from whatever index to whatever index. Here, the index is like this 1-2-3 etcetera, it is relative of the separator.

Usage

```
ptrn_switchr(inpt_l, f_idx_l = c(), t_idx_l = c(), sep = "-", default_val = NA)
```

Arguments

inpt_l	is the input vector
f_idx_l	is a vector containing the indexes of the pattern you want to be altered.
t_idx_l	is a vector containing the indexes to which the indexes in f_idx_l are related.
sep	is the separator, defaults to "-"
default_val	is the default value , if not set to NA, of the pattern at the indexes in f_idx_l. If it is not set to NA, you do not need to fill t_idx_l because this is the vector containing the indexes of the patterns that will be set as new values relatively to the indexes in f_idx_l. Defaults to NA.

Examples

```
print(ptrn_switchr(inpt_l=c("2022-01-11", "2022-01-14", "2022-01-21",
"2022-01-01"), f_idx_l=c(1, 2, 3), t_idx_l=c(3, 2, 1)))

#[1] "11-01-2022" "14-01-2022" "21-01-2022" "01-01-2022"

print(ptrn_switchr(inpt_l=c("2022-01-11", "2022-01-14", "2022-01-21",
"2022-01-01"), f_idx_l=c(1), default_val="ee"))

#[1] "ee-01-11" "ee-01-14" "ee-01-21" "ee-01-01"
```

ptrn_twkr	<i>ptrn_twkr</i>
-----------	------------------

Description

Allow to modify the pattern length of element in a vector according to arguments. What is here defined as a pattern is something like this xx-xx-xx or xx/xx/xxx... So it is defined by the separator

Usage

```
ptrn_twkr(
  inpt_l,
  depth = "max",
  sep = "-",
  default_val = "0",
  add_sep = TRUE,
  end_ = TRUE
)
```

Arguments

<code>inpt_l</code>	is the input vector
<code>depth</code>	is the number (numeric) of separator it will keep as a result. To keep the number of separator of the element that has the minimum amount of separator do <code>depth="min"</code> and <code>depth="max"</code> (character) for the opposite. This value defaults to "max".
<code>sep</code>	is the separator of the pattern, defaults to "-"
<code>default_val</code>	is the default val that will be placed between the separator, defaults to "00"
<code>add_sep</code>	defaults to TRUE. If set to FALSE, it will remove the separator for the patterns that are included in the interval between the depth amount of separator and the actual number of separator of the element.
<code>end_</code>	is if the default_val will be added at the end or at the beginning of each element that lacks length compared to depth

Examples

```
v <- c("2012-06-22", "2012-06-23", "2022-09-12", "2022")

ptrn_twkr(inpt_l=v, depth="max", sep="-", default_val="00", add_sep=TRUE)

#[1] "2012-06-22" "2012-06-23" "2022-09-12" "2022-00-00"

ptrn_twkr(inpt_l=v, depth=1, sep="-", default_val="00", add_sep=TRUE)

#[1] "2012-06" "2012-06" "2022-09" "2022-00"

ptrn_twkr(inpt_l=v, depth="max", sep="-", default_val="00", add_sep=TRUE, end_=FALSE)

#[1] "2012-06-22" "2012-06-23" "2022-09-12" "00-00-2022"
```

<code>read_edm_parser</code>	<i>read_edm_parser</i>
------------------------------	------------------------

Description

Allow to read data from edm parsed dataset, see examples

Usage

```
read_edm_parser(inpt, to_find_v = c())
```

Arguments

`inpt` is the input dataset
`to_find_v` is the vector containing the path to find the data, see examples

Examples

```
print(read_edm_parser("(ok(ee:56))(ok(oui(rr((rr2:6)(rr:5))))(oui(bb(rr2:1)))(ee1:4))",
  to_find_v = c("ok", "oui", "rr", "rr2")))

[1] "6"

print(read_edm_parser("(ok(ee:56))(ok(oui(rr((rr2:6)(rr:5))))(oui(bb(rr2:1)))(ee1:4))", t
  to_find_v = c("ok", "oui", "rr", "rr2")))

[1] "56"

print(read_edm_parser("(ok(ee:56))(ok(oui(rr((rr2:6)(rr:5))))(oui(bb(rr2:1)))(ee1:4))", t
  to_find_v = c("ok", "oui", "rr", "rr2")))

[1] "56"
```

```
rearangr_v
```

```
rearangr_v
```

Description

Rearranges a vector "w_v" according to another vector "inpt_v". `inpt_v` contains a sequence of number. `inpt_v` and `w_v` have the same size and their indexes are related. The output will be a vector containing all the elements of `w_v` rearranges in descending or ascending order according to `inpt_v`

Usage

```
rearangr_v(inpt_v, w_v, how = "increasing")
```

Arguments

`inpt_v` is the vector that contains the sequence of number
`w_v` is the vector containing the elements related to `inpt_v`
`how` is the way the elements of `w_v` will be outputed according to if `inpt_v` will be sorted ascendigly or descendigly

Examples

```
print(rearangr_v(inpt_v=c(23, 21, 56), w_v=c("oui", "peut", "non"), how="decreasing"))

#[1] "non" "oui" "peut"
```

```
regex_spe_detect      regex_spe_detect
```

Description

Takes a character as input and returns its regex-friendly character for R.

Usage

```
regex_spe_detect (inpt)
```

Arguments

`inpt` the input character

Examples

```
print(regex_spe_detect("o"))

[1] "o"

print(regex_spe_detect("("))

[1] "\\("

print(regex_spe_detect("tr(o)m"))

[1] "tr\\(o\\)m"

print(regex_spe_detect(inpt="fggfg[fggf]fgfg(vg?fgfgf.gf)"))

[1] "fggfg\\[fggf\\]fgfg\\(vg\\?fgfgf\\.gf\\)"

print(regex_spe_detect(inpt = "---"))

[1] "\\-\\-\\-"
```

```
regroupr      regroupr
```

Description

Allow to sort data like "c(X1/Y1/Z1, X2/Y1/Z2, ...)" to what you want. For example it can be to "c(X1/Y1/21, X1/Y1/Z2, ...)"

Usage

```
regroupr (
  inpt_v,
  sep_ = "-",
  order = c(1:length(unlist(strsplit(x = inpt_v[1], split = sep_)))),
  l_order = NA
)
```

Arguments

<code>inpt_v</code>	is the input vector containing all the data you want to sort in a specific way. All the sub-elements should be separated by a unique separator such as "-" or "/"
<code>sep_</code>	is the unique separator separating the sub-elements in each elements of <code>inpt_v</code>
<code>order</code>	is a vector describing the way the elements should be sorted. For example if you want this dataset "c(X1/Y1/Z1, X2/Y1/Z2, ...)" to be sorted by the last element you should have <code>order=c(3:1)</code> , for example, and it should returns something like this c(X1/Y1/Z1, X2/Y1/Z1, X1/Y2/Z1, ...) assuming you have only two values for X.
<code>l_order</code>	is a list containing the vectors of values you want to order first for each sub-elements

Examples

```
vec <- multitud(l=list(c("a", "b"), c("1", "2"), c("A", "Z", "E"), c("Q", "F")), sep_="/")

print(vec)

# [1] "a/1/A/Q" "b/1/A/Q" "a/2/A/Q" "b/2/A/Q" "a/1/Z/Q" "b/1/Z/Q" "a/2/Z/Q"
# [8] "b/2/Z/Q" "a/1/E/Q" "b/1/E/Q" "a/2/E/Q" "b/2/E/Q" "a/1/A/F" "b/1/A/F"
#[15] "a/2/A/F" "b/2/A/F" "a/1/Z/F" "b/1/Z/F" "a/2/Z/F" "b/2/Z/F" "a/1/E/F"
#[22] "b/1/E/F" "a/2/E/F" "b/2/E/F"

print(regroupr(inpt_v=vec, sep_="/"))

# [1] "a/1/1/1" "a/1/2/2" "a/1/3/3" "a/1/4/4" "a/1/5/5" "a/1/6/6"
# [7] "a/2/7/7" "a/2/8/8" "a/2/9/9" "a/2/10/10" "a/2/11/11" "a/2/12/12"
#[13] "b/1/13/13" "b/1/14/14" "b/1/15/15" "b/1/16/16" "b/1/17/17" "b/1/18/18"
#[19] "b/2/19/19" "b/2/20/20" "b/2/21/21" "b/2/22/22" "b/2/23/23" "b/2/24/24"

vec <- vec[-2]

print(regroupr(inpt_v=vec, sep_="/"))

# [1] "a/1/1/1" "a/1/2/2" "a/1/3/3" "a/1/4/4" "a/1/5/5" "a/1/6/6"
# [7] "a/2/7/7" "a/2/8/8" "a/2/9/9" "a/2/10/10" "a/2/11/11" "a/2/12/12"
#[13] "b/1/13/13" "b/1/14/14" "b/1/15/15" "b/1/16/16" "b/1/17/17" "b/2/18/18"
#[19] "b/2/19/19" "b/2/20/20" "b/2/21/21" "b/2/22/22" "b/2/23/23"

print(regroupr(inpt_v=vec, sep_="/", order=c(4:1)))

#[1] "1/1/A/Q" "2/2/A/Q" "3/3/A/Q" "4/4/A/Q" "5/5/Z/Q" "6/6/Z/Q"
# [7] "7/7/Z/Q" "8/8/Z/Q" "9/9/E/Q" "10/10/E/Q" "11/11/E/Q" "12/12/E/Q"
#[13] "13/13/A/F" "14/14/A/F" "15/15/A/F" "16/16/A/F" "17/17/Z/F" "18/18/Z/F"
#[19] "19/19/Z/F" "20/20/Z/F" "21/21/E/F" "22/22/E/F" "23/23/E/F" "24/24/E/F"
```

rm_na_rows

rm_na_rows

Description

Allow to remove certain rows that contains NA, see examples.

Usage

```
rm_na_rows(inpt_datf, flagged_vals = c())
```

Arguments

`inpt_datf` is the input dataframe

`flagged_vals` is a vector containing the characters that will drop any rows that contains it

Examples

```
datf <- data.frame(c(1, 2, NA, 4), c(1:4))
print(datf)
```

```
  c.1..2..NA..4. c.1.4.
1             1      1
2             2      2
3            NA      3
4             4      4
```

```
print(rm_na_rows(inpt_datf = datf))
```

```
  c.1..2..NA..4. c.1.4.
1             1      1
2             2      2
4             4      4
```

rm_rows

rm_rows

Description

Allow to remove certain rows that contains certains characters, see examples.

Usage

```
rm_rows(inpt_datf, flagged_vals = c())
```

Arguments

`inpt_datf` is the input dataframe

`flagged_vals` is a vector containing the characters that will drop any rows that contains it

Examples

```
datf <- data.frame(c(1, 2, NA, 4), c(1:4))
print(datf)
```

```
  c.1..2..NA..4. c.1.4.
1             1      1
2             2      2
3            NA      3
4             4      4
```

```
print(rm_rows(inpt_datf = datf, flagged_vals = c(1, 4)))  
  
  c.1..2..NA..4. c.1.4.  
2           2      2  
3           NA     3
```

row_to_col	<i>row_to_col</i>
------------	-------------------

Description

Allow to reverse a dataframe (rows become cols and cols become rows)

Usage

```
row_to_col(inpt_datf)
```

Arguments

inpt_datf is the inout dataframe

Examples

```
datf_test <- data.frame(c(1, 11), c(2, 10), c(3, 9), c(4, 8))  
  
print(datf_test)  
  
  c.1..11. c.2..10. c.3..9. c.4..8.  
1           1           2           3           4  
2          11          10          9          8  
  
print(row_to_col(inpt_datf = datf_test))  
  
  1  2  
1 1 11  
2 2 10  
3 3  9  
4 4  8
```

r_print	<i>r_print</i>
---------	----------------

Description

Allow to print vector elements in one row.

Usage

```
r_print(inpt_v, sep_ = "and", begn = "This is", end = ", voila!")
```

Arguments

- inpt_v is the input vector
- sep_ is the separator between each elements
- begn is the character put at the beginning of the print
- end is the character put at the end of the print

Examples

```
print(r_print(inpt_v=c(1:33)))

#[1] "This is  1 and 2 and 3 and 4 and 5 and 6 and 7 and 8 and 9 and 10 and 11 and 12 and
#and 14 and 15 and 16 and 17 and 18 and 19 and 20 and 21 and 22 and 23 and 24 and 25 and
#and 27 and 28 and 29 and 30 and 31 and 32 and 33 and , voila!"
```

save_untl	<i>save_untl</i>
-----------	------------------

Description

Get the elements in each vector from a list that are located before certain values

Usage

```
save_untl(inpt_l = list(), val_to_stop_v = c())
```

Arguments

- inpt_l is the input list containing all the vectors
- val_to_stop_v is a vector containing the values that marks the end of the vectors returned in the returned list, see the examples

Examples

```
print(save_untl(inpt_l=list(c(1:4), c(1, 1, 3, 4), c(1, 2, 4, 3)), val_to_stop_v=c(3, 4)))

#[[1]]
#[1] 1 2
#
#[[2]]
#[1] 1 1
#
#[[3]]
#[1] 1 2

print(save_untl(inpt_l=list(c(1:4), c(1, 1, 3, 4), c(1, 2, 4, 3)), val_to_stop_v=c(3)))

#[[1]]
#[1] 1 2
#
#[[2]]
```

```
#[1] 1 1
#
#[[3]]
#[1] 1 2 4
```

see_datf

see_datf

Description

Allow to return a dataframe with special value cells (ex: TRUE) where the condition entered are respected and another special value cell (ex: FALSE) where these are not

Usage

```
see_datf(
  datf,
  condition_l,
  val_l,
  conjunction_l = c(),
  rt_val = TRUE,
  f_val = FALSE
)
```

Arguments

<code>datf</code>	is the input dataframe
<code>condition_l</code>	is the vector of the possible conditions ("==", ">", "<", "!=", "%%", "reg", "not_reg", "sup_nchar", "inf_nchar", "nchar") (equal to some elements in a vector, greater than, lower than, not equal to, is divisible by, the regex condition returns TRUE, the regex condition returns FALSE, the length of the elements is strictly superior to X, the length of the element is strictly inferior to X, the length of the element is equal to one element in a vector), you can put the same condition n times.
<code>val_l</code>	is the list of vectors containing the values or vector of values related to <code>condition_l</code> (so the vector of values has to be placed in the same order)
<code>conjunction_l</code>	contains the and or conjunctions, so if the length of <code>condition_l</code> is equal to 3, there will be 2 conjunctions. If the length of <code>conjunction_l</code> is inferior to the length of <code>condition_l</code> minus 1, <code>conjunction_l</code> will match its goal length value with its last argument as the last arguments. For example, <code>c("&", "l", "&")</code> with a goal length value of 5 -> <code>c("&", "l", "&", "&", "&")</code>
<code>rt_val</code>	is a special value cell returned when the conditions are respected
<code>f_val</code>	is a special value cell returned when the conditions are not respected

Details

This function will return an error if number only comparative conditions are given in addition to having character values in the input dataframe.

Examples

```

datf1 <- data.frame(c(1, 2, 4), c("a", "a", "zu"))

print(see_datf(datf=datf1, condition_l=c("nchar"), val_l=list(c(1))))

#      X1      X2
#1 TRUE   TRUE
#2 TRUE   TRUE
#3 TRUE FALSE

print(see_datf(datf=datf1, condition_l=c("=="), val_l=list(c("a", 1))))

#      X1      X2
#1 TRUE   TRUE
#2 FALSE  TRUE
#3 FALSE FALSE

print(see_datf(datf=datf1, condition_l=c("nchar"), val_l=list(c(1, 2))))

#      X1      X2
#1 TRUE   TRUE
#2 TRUE   TRUE
#3 TRUE   TRUE

print(see_datf(datf=datf1, condition_l=c("not_reg"), val_l=list("[a-z]")))

#      X1      X2
#1 TRUE FALSE
#2 TRUE FALSE
#3 TRUE FALSE

```

see_diff

see_diff

Description

Output the opposite of intersect(a, b). Already seen at: <https://stackoverflow.com/questions/19797954/function-to-find-symmetric-difference-opposite-of-intersection-in-r>

Usage

```
see_diff(vec1 = c(), vec2 = c())
```

Arguments

vec1	is the first vector
vec2	is the second vector

Examples

```
print(see_diff(c(1:7), c(4:12)))

[1] 1 2 3 8 9 10 11 12
```

see_diff_all	<i>see_diff_all</i>
--------------	---------------------

Description

Allow to perform the opposite of intersect function to n vectors.

Usage

```
see_diff_all(...)
```

Arguments

... are all the input vectors

Examples

```
vec1 <- c(3:6)
vec2 <- c(1:8)
vec3 <- c(12:16)

print(see_diff_all(vec1, vec2))

[1] 1 2 7 8

print(see_diff_all(vec1, vec2, vec3))

[1] 3 4 5 6 1 2 7 8 12 13 14 15 16
```

see_diff_detailed	<i>see_diff_detailed</i>
-------------------	--------------------------

Description

Behaves exactly like the see_diff function but is written more explicitly, see examples

Usage

```
see_diff_detailed(vec1 = c(), vec2 = c())
```

Arguments

vec1	is one of the input vector
vec2	is the other input vector

Examples

```
print(see_diff_detailed(c(1:6), c(3:9)))

[1] 1 2 7 8 9
```

see_file

see_file

Description

Allow to get the filename or its extension

Usage

```
see_file(string_, index_ext = 1, ext = TRUE)
```

Arguments

string_	is the input string
index_ext	is the occurrence of the dot that separates the filename and its extension
ext	is a boolean that if set to TRUE, will return the file extension and if set to FALSE, will return filename

Examples

```
print(see_file(string_="file.abc.xyz"))

#[1] ".abc.xyz"

print(see_file(string_="file.abc.xyz", ext=FALSE))

#[1] "file"

print(see_file(string_="file.abc.xyz", index_ext=2))

#[1] ".xyz"
```

see_idx

see_idx

Description

Returns a boolean vector to see if a set of elements contained in v1 is also contained in another vector (v2)

Usage

```
see_idx(v1, v2)
```

Arguments

v1 is the first vector
v2 is the second vector

Examples

```
print(see_idx(v1=c("oui", "non", "peut", "oo"), v2=c("oui", "peut", "oui")))  
#[1] TRUE FALSE TRUE FALSE
```

see_inside	see_inside
------------	------------

Description

Return a list containing all the column of the files in the current directory with a chosen file extension and its associated file and sheet if xlsx. For example if i have 2 files "out.csv" with 2 columns and "out.xlsx" with 1 column for its first sheet and 2 for its second one, the return will look like this: c(column_1, column_2, column_3, column_4, column_5, unique_separator, "1-2-out.csv", "3-3-sheet_1-out.xlsx", 4-5-sheet_2-out.xlsx)

Usage

```
see_inside(  
  pattern_,  
  path_ = ".",  
  sep_ = c(", "),  
  unique_sep = "#####",  
  rec = FALSE  
)
```

Arguments

pattern_ is a vector containin the file extension of the spreadsheets ("xlsx", "csv"...)
path_ is the path where are located the files
sep_ is a vector containing the separator for each csv type file in order following the operating system file order, if the vector does not match the number of the csv files found, it will assume the separator for the rest of the files is the same as the last csv file found. It means that if you know the separator is the same for all the csv type files, you just have to put the separator once in the vector.
unique_sep is a pattern that you know will never be in your input files
rec is a boolean allows to get files recursively if set to TRUE, defaults to TRUE If x is the return value, to see all the files name, position of the columns and possible sheet name associated with, do the following:

see_in_grep	<i>see_in_grep</i>
-------------	--------------------

Description

Allow to get the indices of the elements of a vector that contains certyain patterns. The type of the output may change in function of the input vectors, see examples

Usage

```
see_in_grep(from_v = c(), in_v = c())
```

Arguments

from_v	is the vector that may contains elements that contains the same patterns that those in in_v, see examples
in_v	is a vector that contains the patterns to find

Examples

```
print(see_in_grep(from_v = c("oui", "non", "peut"),
                  in_v = c("ou", "eu", "plm")))

      ou      eu      plm
      1      3      -1

print(see_in_grep(from_v = c("oui", "non", "peut", "oui"),
                  in_v = c("ou", "eu", "plm")))

$ou
[1] 1 4

$eu
[1] 3

$plm
[1] -1
```

see_in_l	<i>see_in_l</i>
----------	-----------------

Description

Allow to get the patterns that are present in the elements of a vector, see examples

Usage

```
see_in_l(from_v = c(), in_v = c())
```

Arguments

`from_v` is the vector that may contains elements that contains the same patterns that those in `in_v`, see examples

`in_v` is a vector that contains the patterns to find

Examples

```
print(see_in_l(from_v = c("oui", "non", "peut"),
  in_v = c("ou", "pe", "plm")))

      ou    pe    plm
TRUE TRUE FALSE
```

`see_mode`

see_mode

Description

Allow to get the mode of a vector, see examples.

Usage

```
see_mode(inpt_v = c())
```

Arguments

`inpt_v` is the input vector

Examples

```
print(see_mode(inpt_v = c(1, 1, 2, 2, 2, 3, 1, 2)))

[1] 2

print(see_mode(inpt_v = c(1, 1, 2, 2, 2, 3, 1)))

[1] 1
```

`selected_char`

selected_char

Description

Allow to generate a char based on a combinaison on characters from a vector and a number

Usage

```
selected_char(n, base_char = letters)
```

Arguments

`n` is how many sequence of numbers will be generated
`base_char` is the vector containing the elements from which the character is generated

Examples

```
print(selected_char(1222))

[1] "zta"
```

```
sequence_na_mean1  sequence_na_mean1
```

Description

In a dataframe generated by the function `historic_sequence1`, convert all NA to the mean of the values at the same variable for the individual at the id where the NA occurs, see examples (only accepts numeric variables)

Usage

```
sequence_na_mean1(inpt_datf, bf_)
```

Arguments

`inpt_datf` is the input dataframe

Examples

```
set.seed(123)
var1 <- round(runif(n = 14, min = 100, max = 122))
set.seed(123)
var2 <- round(runif(n = 14, min = 14, max = 20))

datf <- data.frame("ids" = c(20, 20, 20, 20, 19, 19, 19, 18, 18, 18, 18,
17, 17, 17),
"individual" = c("oui", "non", "peut1", "peut2",
"oui", "peut1", "peut2"),
"var1" = var1,
"var2" = var2)
datf <- historic_sequence1(inpt_datf = datf, bf_ = 2)
datf[3, 4] <- NA
datf[6, 4] <- NA
datf[1, 3] <- NA
print(datf)
```

	id_seq	individual	var1-1	var1-2	var2-1	var2-2
1	20	oui	NA	120	20	19
2	20	non	NA	112	NA	17
3	20	peut1	101	NA	14	17
4	20	peut2	112	121	17	20
5	19	oui	120	110	19	17

```

6      19      peut1      110      NA      17      18
7      19      peut2      121      113      20      17

print(sequence_na_mean1(inpt_datf = datf, bf_ = 2))

  id_seq individual var1-1 var1-2 var2-1 var2-2
1      20      oui     115  120.0     20     19
2      20      non     112  112.0     17     17
3      20     peut1     101  105.5     14     17
4      20     peut2     112  121.0     17     20
5      19      oui     120  110.0     19     17
6      19     peut1     110  105.5     17     18
7      19     peut2     121  113.0     20     17

```

```
sequence_na_mean2  sequence_na_mean2
```

Description

In a dataframe generated by the function `historic_sequence1`, convert all NA to the mean of the values at the same variable for the individual at the id where the NA occurs, see examples (only accepts numeric variables)

Usage

```
sequence_na_mean2(inpt_datf, bf_)
```

Arguments

`inpt_datf` is the input dataframe

`bf_` is how at how many n -1 we look for the value of the variables for the individual at time index n

Examples

```

set.seed(123)
var1 <- round(runif(n = 14, min = 100, max = 122))
set.seed(123)
var2 <- round(runif(n = 14, min = 14, max = 20))

datf <- data.frame("ids" = c(20, 20, 20, 20, 19, 19, 19, 18, 18, 18, 18,

```

sort_date

sort_date

Description

Allow to sort any vector containing a date, from any kind of format (my, hdmy, ymd ...), see examples.

Usage

```
sort_date(inpt_v, frmt, sep_ = "-", ascending = FALSE, give = "value")
```

Arguments

inpt_v	is the input vector containing all the dates
frmt	is the format of the dates, (any combinaison of letters "s" for second, "n", for minute, "h" for hour, "d" for day, "m" for month and "y" for year)
sep_	is the separator used for the dates
ascending	is the used to sort the dates
give	takes only two values "index" or "value", if give == "index", the function will output the index of sorted dates from inpt_v, if give == "value", the function will output the value, it means directly the sorted dates in inpt_v, see examples

Examples

```
print(sort_date(inpt_v = c("01-11-2025", "08-08-1922", "12-04-1966")
, frmt = "dmy", sep_ = "-", ascending = TRUE, give = "value"))

sort_normal_qual	<i>sort_normal_qual</i>
------------------	-------------------------

Description

Sort qualitative modalities that have their frequency normally distributed from an unordered dataset, see examples. This function uses an another algorithym than choose_normal_qual2 which may be faster.

Usage

```
sort_normal_qual(inpt_datf)
```

Arguments

`inpt_datf` is the input dataframe, containing the values in the first column and their frequency in the second

Examples

```
sample_val <- round(rnorm(n = 2000, mean = 12, sd = 2), 1)
sample_freq <- unique_total(sample_val)
sample_qual <- infinite_char_seq(n = length(sample_freq))
datf_test <- data.frame(sample_qual, sample_freq)
datf_test[, 2] <- datf_test[, 2] / sum(datf_test[, 2]) # optional
```

```
print(datf_test)
```

```

split_by_step

split_by_step

Description

Allow to split a string or a vector of strings by a step, see examples.

Usage

split_by_step(inpt_v, by)

Arguments

inpt_v is the input character or vector of characters
by is the step

Examples

```
print(split_by_step(inpt_v = c("o", "u", "i", "n", "o", "o", "u", "i", "o", "Z"), by = 2)

[1] "ou" "in" "oo" "ui" "oZ"

print(split_by_step(inpt_v = c("o", "u", "i", "n", "o", "o", "u", "i", "o", "Z"), by = 3)

[1] "oui" "noo" "uio" "Z"

print(split_by_step(inpt_v = c("o", "u", "i", "n", "o", "o", "u", "i", "o", "Z"), by = 4)

[1] "ouin" "ooui" "oZ"

print(split_by_step(inpt_v = 'ouinoouioz', by = 4))

[1] "ouin" "ooui" "oZ"
```

str_remove_untl	<i>str_remove_untl</i>
-----------------	------------------------

Description

Allow to remove pattern within elements from a vector precisely according to their occurrence.

Usage

```
str_remove_untl(
  inpt_v,
  ptrn_rm_v = c(),
  untl = list(c(1)),
  nvr_following_ptrn = "NA"
)
```

Arguments

inpt_v is the input vector
ptrn_rm_v is a vector containing the patterns to remove
until is a list containing the occurrence(s) of each pattern to remove in the elements.
nvr_following_ptrn is a sequel of characters that you are sure is not present in any of the elements in inpt_v

Examples

```
vec <- c("45/56-/98mm", "45/56-/98mm", "45/56-/98-mm/")

print(str_remove_until(inpt_v=vec, ptrn_rm_v=c("-", "/"), until=list(c("max"), c(1))))

#[1] "4556/98mm"      "4556/98mm"      "4556/98mm/"

print(str_remove_until(inpt_v=vec, ptrn_rm_v=c("-", "/"), until=list(c("max"), c(1:2))))

#[1] "455698mm"       "455698mm"       "455698mm/"

print(str_remove_until(inpt_v=vec[1], ptrn_rm_v=c("-", "/"), until=c("max")))

#[1] "455698mm" "455698mm" "455698mm"
```

sub_mult

sub_mult

Description

Performs a sub operation with n patterns and replacements.

Usage

```
sub_mult(inpt_v, pattern_v = c(), replacement_v = c())
```

Arguments

`inpt_v` is a vector containing all the elements that contains expressions to be substituted

`pattern_v` is a vector containing all the patterns to be substituted in any elements of `inpt_v`

`replacement_v` is a vector containing the expression that are going to substitute those provided by `pattern_v`

Examples

```
print(sub_mult(inpt_v = c("X and Y programming languages are great", "More X, more X!"),
  pattern_v = c("X", "Y", "Z"),
  replacement_v = c("C", "R", "GO"))

[1] "C and R programming languages are great"
[2] "More C, more X!"
```

successive_diff	<i>successive_diff</i>
-----------------	------------------------

Description

Allow to see the difference between the successive elements of a numeric vector

Usage

```
successive_diff(inp_v)
```

Arguments

`inp_v` is the input numeric vector

Examples

```
print(successive_diff(c(1:10)))
[1] 1 1 1 1 1

print(successive_diff(c(1:11, 13, 19)))
[1] 1 1 1 1 1 2 6
```

sum_group1	<i>sum_group1</i>
------------	-------------------

Description

Allow to aggregate variables according to groups, do not visually group the individual unlike `sum_group2`, see examples

Usage

```
sum_group1(inp_datf, col_grp = c(), col_to_add = c())
```

Arguments

`inp_datf` is the input dataframe
`col_grp` is a vector containing the column names or the column numbers of the groups
`col_to_add` is a vector containing the column names or the column numbers of the variables to aggregate

Examples

```

set.seed(123)
datf <- data.frame("country" = c("France", "Germany", "France", "Italy", "Italy", "France"),
  "year" = c(2012, 2012, 2013, 2011, 2012, 2011),

swipr

swipr

Description

Returns an ordered dataframes according to the elements order given. The input datafram has two columns, one with the ids which can be bonded to multiple elements in the other column.

Usage

```
swipr(inpt_datf, how_to = c(), id_w = 2, id_ids = 1)
```

Arguments

<code>inpt_datf</code>	is the input dataframe
<code>how_to</code>	is a vector containing the elements in the order wanted
<code>id_w</code>	is the column number or the column name of the elements
<code>id_ids</code>	is the column number or the column name of the ids

Examples

```
datf <- data.frame("col1"=c("Af", "Al", "Al", "Al", "Arg", "Arg", "Arg", "Arm", "Arm", "A"),
  "col2"=c("B", "B", "G", "S", "B", "S", "G", "B", "G", "B"))

print(swipr(inpt_datf=datf, how_to=c("G", "S", "B")))
```

	col1	col2
1	Af	B
2	Al	G
3	Al	S
4	Al	B
5	Arg	G
6	Arg	S
7	Arg	B
8	Arm	G
9	Arm	B
10	Al	B

test_order	<i>test_order</i>
------------	-------------------

Description

Allow to get if two vectors have their commun elements in the same order, see examples

Usage

```
test_order(inpt_v_from, inpt_v_test)
```

Arguments

is	the vector we want to test if its commun element with inpt_v_from are in the same order
----	---

Examples

```
print(test_order(inpt_v_from = c(1:8), inpt_v_test = c(1, 4)))

[1] TRUE

print(test_order(inpt_v_from = c(1:8), inpt_v_test = c(1, 4, 2)))

[1] FALSE
```

time_serie_equalizer	<i>time_serie_equalizer</i>
----------------------	-----------------------------

Description

Allow ewualize the occurence of each elements in all the timestamps, see examples

Usage

```
time_serie_equalizer(
  inpt_datf,
  time_col,
  null_value = 0,
  individual_col,
  var_col = c()
)
```

Arguments

<code>inpt_datf</code>	is the input dataframe
<code>time_col</code>	is the column number or name of the time values
<code>null_value</code>	is the default value of the variable of the elements that will be added
<code>individual_col</code>	is the column name or number of the individuals
<code>var_col</code>	is a vector containing the column names or numbers if the variables that will equal the <code>null_value</code> for the individual at the new time values

Examples

```
print(datf)
```

	individual	country	year	energy_source	twh_cons
1	A	France	1995	biofuel_electricity	1.82
2	A	France	1996	coal_electricity	24.18

18	A	France 2003	biofuel_electricity	0.00
----	---	-------------	---------------------	------

to_unique	<i>to_unique</i>
-----------	------------------

Description

Allow to transform a vector containing elements that have more than 1 occurrence to a vector with only unique elements.

Usage

```
to_unique(inpt_v, distinct_type = "suffix", distinct_val = "number", sep = "-")
```

Arguments

`inpt_v` is the input vectors

`distinct_type` takes two values: suffix or prefix

`distinct_val` takes two values: number (unique sequence of number to differentiate each value) or letter (unique sequence of letters to differentiate each value)

Examples

```
print(to_unique(inpt_v = c("a", "a", "e", "a", "i", "i"),
  distinct_type = "suffix",
  distinct_val = "number",
  sep = "-"))
```

```
[1] "a-1" "a-2" "e" "a-3" "i-1" "i-2"
```

```
print(to_unique(inpt_v = c("a", "a", "e", "a", "i", "i"),
  distinct_type = "suffix",
  distinct_val = "letter",
  sep = "-"))
```

```
[1] "a-a" "a-b" "e" "a-c" "i-a" "i-b"
```

```
print(to_unique(inpt_v = c("a", "a", "e", "a", "i", "i"),
  distinct_type = "prefix",
  distinct_val = "number",
  sep = "/"))
```

```
[1] "1/a" "2/a" "e" "3/a" "1/i" "2/i"
```

```
print(to_unique(inpt_v = c("a", "a", "e", "a", "i", "i"),
  distinct_type = "prefix",
  distinct_val = "letter",
  sep = "_"))
```

```
[1] "a_a" "b_a" "e" "c_a" "a_i" "b_i"
```

union_all

union_all

Description

Allow to perform a union function to n vectors.

Usage

```
union_all(...)
```

Arguments

... are all the input vectors

Examples

```
print(union_all(c(1, 2), c(3, 4), c(1:8)))
[1] 1 2 3 4 5 6 7 8

print(union_all(c(1, 2), c(3, 4), c(7:8)))
[1] 1 2 3 4 7 8
```

union_keep

union_keep

Description

Performs a union operation keeping the number of elements of all input vectors, see examples

Usage

```
union_keep(...)
```

Arguments

... are all the input vectors

Examples

```
print(union_keep(c("a", "ee", "ee"), c("p", "p", "a", "i"), c("a", "a", "z")))
[1] "a" "ee" "ee" "p" "p" "i" "z"

print(union_keep(c("a", "ee", "ee"), c("p", "p", "a", "i")))
[1] "a" "ee" "ee" "p" "p" "i"
```

unique_datf	<i>unique_datf</i>
-------------	--------------------

Description

Returns the input dataframe with the unique columns or rows.

Usage

```
unique_datf(inpt_datf, col = FALSE)
```

Arguments

- inpt_datf is the input dataframe
- col is a parameter that specifies if the dataframe returned should have unique columns or rows, defaults to F, so the dataframe returned by default has unique rows

Examples

```
datf1 <- data.frame(c(1, 2, 1, 3), c("a", "z", "a", "p"))

print(datf1)

  c.1..2..1..3. c..a....z....a....p.. c.1..2..1..3..1
1              1                      a              1
2              2                      z              2
3              1                      a              1
4              3                      p              3

print(unique_datf(inpt_datf=datf1))

#   c.1..2..1..3. c..a....z....a....p..
#1              1                      a
#2              2                      z
#4              3                      p

datf1 <- data.frame(c(1, 2, 1, 3), c("a", "z", "a", "p"), c(1, 2, 1, 3))

print(datf1)

  c.1..2..1..3. c..a....z....a....p..
1              1                      a
2              2                      z
3              1                      a
4              3                      p

print(unique_datf(inpt_datf=datf1, col=TRUE))

#   cur_v cur_v
#1      1     a
#2      2     z
#3      1     a
#4      3     p
```

<code>unique_ltr_from_v</code>	<code>unique_ltr_from_v</code>
--------------------------------	--------------------------------

Description

Returns the unique characters contained in all the elements from an input vector "inpt_v"

Usage

```
unique_ltr_from_v(inpt_v, keep_v = c("?", "!", ":", "&", ",", ".", letters))
```

Arguments

`inpt_v` is the input vector containing all the elements
`keep_v` is the vector containing all the characters that the elements in `inpt_v` may contain

Examples

```
print(unique_ltr_from_v(inpt_v=c("bonjour", "lpoerc", "nonnour", "bonnour", "nonjour", "a  
# [1] "b" "o" "n" "j" "u" "r" "l" "p" "e" "c" "a" "v" "i"
```

<code>unique_pos</code>	<code>unique_pos</code>
-------------------------	-------------------------

Description

Allow to find the first index of the unique values from a vector.

Usage

```
unique_pos(vec)
```

Arguments

`vec` is the input vector

Examples

```
print(unique_pos(vec=c(3, 4, 3, 5, 6)))  
# [1] 1 2 4 5
```

unique_total	<i>unique_total</i>
--------------	---------------------

Description

Returns a vector with the total amount of occurrences for each element in the input vector. The occurrences of each element follow the same order as the unique function does, see examples

Usage

```
unique_total(inpt_v = c())
```

Arguments

`inpt_v` is the input vector containing all the elements

Examples

```
print(unique_total(inpt_v = c(1:12, 1)))

[1] 2 1 1 1 1 1 1 1 1 1 1 1

print(unique_total(inpt_v = c(1:12, 1, 11, 11)))

[1] 2 1 1 1 1 1 1 1 1 1 3 1

vec <- c(1:12, 1, 11, 11)
names(vec) <- c(1:15)
print(unique_total(inpt_v = vec))

 1  2  3  4  5  6  7  8  9 10 11 12
2  1  1  1  1  1  1  1  1  1  3  1
```

until_stnl	<i>until_stnl</i>
------------	-------------------

Description

Maxes a vector to a chosen length. ex: if i want my vector `c(1, 2)` to be 5 of length this function will return me: `c(1, 2, 1, 2, 1)`

Usage

```
until_stnl(vec1, goal)
```

Arguments

`vec1` is the input vector
`goal` is the length to reach

Examples

```
print(until_stnl(vec1=c(1, 3, 2), goal=56))

# [1] 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3
#[39] 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3 2 1 3
```

val_replacer	<i>val_replacer</i>
--------------	---------------------

Description

Allow to replace value from dataframe to another one.

Usage

```
val_replacer(datf, val_replaced, val_replacor = TRUE)
```

Arguments

- datf is the input dataframe
- val_replaced is a vector of the value(s) to be replaced
- val_replacor is the value that will replace val_replaced

Examples

```
print(val_replacer(datf=data.frame(c(1, "oo4", TRUE, FALSE), c(TRUE, FALSE, TRUE, TRUE)),
  val_replaced=c(TRUE), val_replacor="NA"))

# c.1...oo4...T..F. c.T..F..T..T.
#1 1 NA
#2 oo4 FALSE
#3 NA NA
#4 FALSE NA
```

vector_replacor	<i>vector_replacor</i>
-----------------	------------------------

Description

Allow to replace certain values in a vector.

Usage

```
vector_replacor(inpt_v = c(), sus_val = c(), rpl_val = c(), grep_ = FALSE)
```

Arguments

<code>inpt_v</code>	is the input vector
<code>sus_val</code>	is a vector containing all the values that will be replaced
<code>rpl_val</code>	is a vector containing the value of the elements to be replaced (<code>sus_val</code>), so <code>sus_val</code> and <code>rpl_val</code> should be the same size
<code>grep_</code>	is if the elements in <code>sus_val</code> should be equal to the elements to replace in <code>inpt_v</code> or if they just should found in the elements

Examples

```
print(vector_replacor(inpt_v=c(1:15), sus_val=c(3, 6, 8, 12),
  rpl_val=c("oui", "non", "e", "a")))

# [1] "1"  "2"  "oui" "4"  "5"  "non" "7"  "e"  "9"  "10" "11" "a"
# [13] "13" "14" "15"

print(vector_replacor(inpt_v=c("non", "zez", "pp a ftf", "fdatfd", "assistance",
  "ert", "repas", "repos"),
  sus_val=c("pp", "as", "re"), rpl_val=c("oui", "non", "zz"), grep_=TRUE))

# [1] "non" "zez" "oui" "fdatfd" "non" "ert" "non" "zz"
```

<code>vec_in_datf</code>	<i>vec_in_datf</i>
--------------------------	--------------------

Description

Allow to get if a vector is in a dataframe. Returns the row and column of the vector in the dataframe if the vector is contained in the dataframe.

Usage

```
vec_in_datf(
  inpt_datf,
  inpt_vec = c(),
  coeff = 0,
  stop_untl = 1,
  conventional = FALSE
)
```

Arguments

<code>inpt_datf</code>	is the input dataframe
<code>inpt_vec</code>	is the vector that may be in the input dataframe
<code>coeff</code>	is the "slope coefficient" of <code>inpt_vec</code>
<code>stop_untl</code>	is the maximum number of the input vector the function returns, if in the dataframe
<code>conventional</code>	is if a positive slope coefficient means that the vector goes upward or downward

Examples

```
datf1 <- data.frame(c(1:5), c(5:1), c("a", "z", "z", "z", "a"))

print(datf1)

#  c.1.5. c.5.1. c..a....z....z....z....a..
#1      1      5                      a
#2      2      4                      z
#3      3      3                      z
#4      4      2                      z
#5      5      1                      a

print(vec_in_datf(inpt_datf=datf1, inpt_vec=c(5, 4, "z"), coeff=1))

#NULL

print(vec_in_datf(inpt_datf=datf1, inpt_vec=c(5, 2, "z"), coeff=1))

#[1] 5 1

print(vec_in_datf(inpt_datf=datf1, inpt_vec=c(3, "z"), coeff=1))

#[1] 3 2

print(vec_in_datf(inpt_datf=datf1, inpt_vec=c(4, "z"), coeff=-1))

#[1] 2 2

print(vec_in_datf(inpt_datf=datf1, inpt_vec=c(2, 3, "z"), coeff=-1))

#[1] 2 1

print(vec_in_datf(inpt_datf=datf1, inpt_vec=c(5, 2, "z"), coeff=-1, conventional=TRUE))

#[1] 5 1

datf1[4, 2] <- 1

print(vec_in_datf(inpt_datf=datf1, inpt_vec=c(1, "z"), coeff=-1, conventional=TRUE, stop_

#[1] 4 2 5 2
```

vlookup_datf	<i>vlookup_datf</i>
--------------	---------------------

Description

Allow to perform a vlookup on a dataframe

Usage

```
vlookup_datf(datf, v_id, col_id = 1, included_col_id = "yes")
```

Arguments

`datf` is the input dataframe
`v_id` is a vector containing the ids
`col_id` is the column that contains the ids (default is equal to 1)
`included_col_id` is if the result should return the `col_id` (default set to yes)

Examples

```
datf1 <- data.frame(c("az1", "az3", "az4", "az2"), c(1:4), c(4:1))

print(vlookup_datf(datf=datf1, v_id=c("az1", "az2", "az3", "az4")))
```

#	c..az1....az3....az4....az2..	c.1.4.	c.4.1.
#2	az1	1	4
#4	az2	4	1
#21	az3	2	3
#3	az4	3	2

wider_datf	<i>wider_datf</i>
------------	-------------------

Description

Takes a dataframe as an input and the column to split according to a separator.

Usage

```
wider_datf(inpt_datf, col_to_splt = c(), sep_ = "-")
```

Arguments

`inpt_datf` is the input dataframe
`col_to_splt` is a vector containing the number or the colnames of the columns to split according to a separator
`sep_` is the separator of the elements to split to new columns in the input dataframe

Examples

```
datf1 <- data.frame(c(1:5), c("o-y", "hj-yy", "er-y", "k-ll", "ooo-mm"), c(5:1))

datf2 <- data.frame("col1"=c(1:5), "col2"=c("o-y", "hj-yy", "er-y", "k-ll", "ooo-mm"))

print(wider_datf(inpt_datf=datf1, col_to_splt=c(2), sep_="-"))
```

#	pre_datf	X.o.	X.y.
#o-y	1	"o"	"y" 5
#hj-yy	2	"hj"	"yy" 4
#er-y	3	"er"	"y" 3
#k-ll	4	"k"	"ll" 2

```
#ooo-mm 5      "ooo" "mm" 1

print(wider_datf(inpt_datf=datf2, col_to_splt=c("col2"), sep="-"))

#      pre_datf X.o.  X.y.
#o-y   1      "o"   "y"
#hj-yy 2      "hj"  "yy"
#er-y   3      "er"  "y"
#k-ll   4      "k"   "ll"
#ooo-mm 5      "ooo" "mm"
```

```
wide_to_narrow_idx wide_to_narrow_idx
```

Description

Allow to convert the indices of vector ('from_v_ids') which are related to each characters of a vector, to fit the newly established maximum character of the vector, see examples.

Usage

```
wide_to_narrow_idx(from_v_val = c(), from_v_ids = c(), val = 1)
```

Arguments

from_v_val	is the input vector of elements, or just the total number of characters of the elementsq in the vector
from_v_ids	is the input vector of indices
val	is the value - 1 from which the number of character of an element is too high, so the indices in 'from_v_ids' will be modified

Examples

```
print(wide_to_narrow_idx(from_v_val = c("oui", "no", "oui"), from_v_ids = c(4, 6, 9), val = 5))
[1] 2 4 5

print(wide_to_narrow_idx(from_v_val = c("oui", "no", "oui"), from_v_ids = c(4, 6, 9), val = 3))
[1] 2 2 3

print(wide_to_narrow_idx(from_v_val = c("oui", "no", "oui"), from_v_ids = c(4, 6, 9), val = 4))
[1] 4 6 9
```

write_edm_parser	<i>write_edm_parser</i>
------------------	-------------------------

Description

Allow to write data to edm parsed dataset, see examples

Usage

```
write_edm_parser(inpt, to_write_v, write_data)
```

Arguments

`inpt` is the input dataset
`to_write_v` is the vector containing the path to write the data, see examples

Examples

```
print(write_edm_parser("(ok(ee:56))(ok(oui(rr((rr2:6)(rr:5))))(oui(bb(rr2:1)))(ee1:4))",
  to_write_v = c("ok", "ee"), write_data = c("ii", "olm")))

[1] "(ok(ee:56)(ii:olm))(ok(oui(rr((rr2:6)(rr:5))))(oui(bb(rr2:1)))(ee1:4))"

print(write_edm_parser("(ok(ee:56))(ok(oui(rr((rr2:6)(rr:5))))(oui(bb(rr2:1)))(ee1:4))",
  to_write_v = c("ok", "oui"), write_data = c("ii", "olm")))

[1] "(ok(ee:56))(ok(oui(rr((rr2:6)(rr:5))))(ii:olm)(oui(bb(rr2:1)))(ee1:4))"

print(write_edm_parser("(ok(ee:56))(ok(oui(rr((rr2:6)(rr:5))))(oui(bb(rr2:1)))(ee1:4))",
  to_write_v = c("ok", "oui", "oui"), write_data = c("ii", "olm")))

[1] "(ok(ee:56))(ok(oui(rr((rr2:6)(rr:5))))(oui(bb(rr2:1)))(ii:olm)(ee1:4))"

print(write_edm_parser("",
  to_write_v = c(), write_data = c("ii", "olm")))

[1] "(ii:olm)"
```
